

# Prospects for SUSY dark matter in light of LHC Run 2 results

---

Emanuele A. Bagnaschi (DESY Hamburg)

26 July 2018  
SUSY 2018  
Barcellona, Spain

Based on E. Bagnaschi, K. Sakurai et al. [1710.11091]  
and J.C. Costa, E. Bagnaschi, K. Sakurai et al. [1711.00458]

# Introduction

---

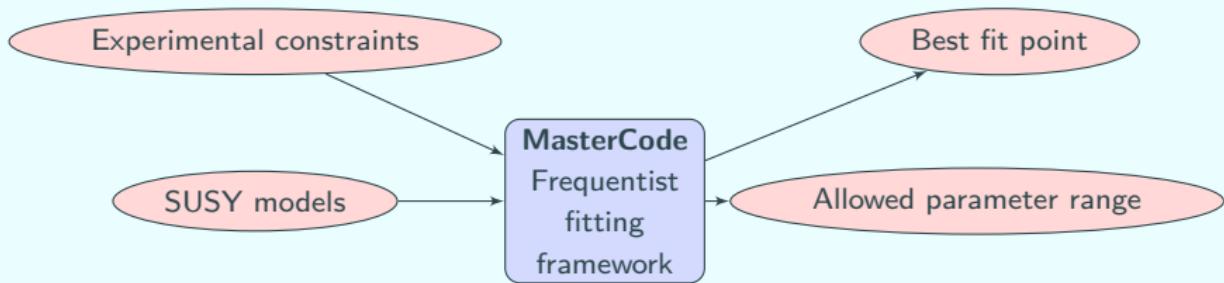

# The Minimal Supersymmetric Standard Model

Chiral supermultiplets				
Name	Symbol	spin 0	spin 1/2	$(SU(3)_C, SU(2)_L, U(1)_Y)$
squarks,quarks ( $\times 3$ families)	$Q$	$(\tilde{u}_L, \tilde{d}_L)$	$(u_L, d_L)$	$(\mathbf{3}, \mathbf{2}, \frac{1}{6})$
	$\bar{u}$	$\tilde{u}_R^*$	$u_R^\dagger$	$(\bar{\mathbf{3}}, \mathbf{1}, -\frac{2}{3})$
	$\bar{d}$	$\tilde{d}_R^*$	$d_R^\dagger$	$(\bar{\mathbf{3}}, \mathbf{1}, \frac{1}{3})$
sleptons, leptons ( $\times 3$ families)	$L$	$(\tilde{\nu}, \tilde{e}_L)$	$(\nu, e_L)$	$(\mathbf{1}, \mathbf{2}, -\frac{1}{2})$
	$\bar{e}$	$\tilde{e}_R^*$	$e_R^\dagger$	$(\mathbf{1}, \mathbf{1}, 1)$
Higgses, Higgsinos	$H_u$	$(H_u^+, H_u^0)$	$(\tilde{H}_u^+, \tilde{H}_u^0)$	$(\mathbf{1}, \mathbf{2}, \frac{1}{2})$
	$H_d$	$(H_d^0, H_d^-)$	$(\tilde{H}_d^0, \tilde{H}_d^-)$	$(\mathbf{1}, \mathbf{2}, -\frac{1}{2})$
Gauge supermultiplets				
Name		spin 1/2	spin 1	$(SU(3)_C, SU(2)_L, U(1)_Y)$
gluino, gluon winos, W bosons bino, B boson		$\tilde{g}$	$g$	$(\mathbf{8}, \mathbf{1}, 0)$
		$\tilde{W}^\pm$	$W^\pm$	$(\mathbf{1}, \mathbf{3}, 0)$
		$\tilde{B}^0$	$B^0$	$(\mathbf{1}, \mathbf{1}, 0)$

# Physical motivations

## Global fits

- In the unconstrained MSSM 105 new free parameters (masses, mixing angles and phases). Impossible/uninteresting to probe.
- Define a simplified model based on reasonable assumptions and a minor number of free parameters.
- Use of the available collider data, electro-weak precision observables and DM constraint to fit the best value and the likelihood profile of the model parameters.
- Effectively implement interplay between different searches (e.g. collider vs direct detection for DM).

# The scenarios

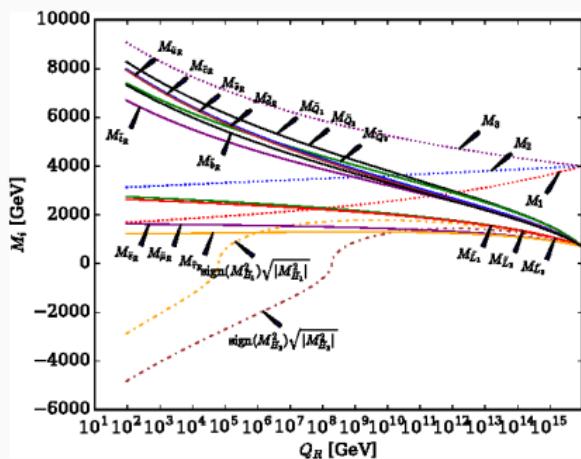

---

# MSSM scenarios

## GUT Models

### CMSSM

$m_0, m_{1/2}, A_0, \tan \beta$

- Introduce correlation between the colored and uncolored sectors.

## GUT Models

### NUHM1/NUHM2

$m_0, m_{1/2}, A_0, \tan \beta, m_{H_u}, m_{H_d}$

### SU(5)

$m_{1/2}, m_{\bar{5}}, m_{10}, m_{H_u}, m_{H_d}, A_0, \tan \beta$

## mAMSB

$m_0, m_{3/2}, \tan \beta$

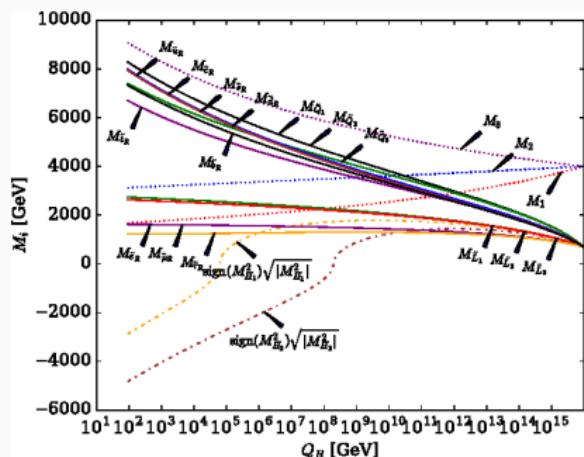

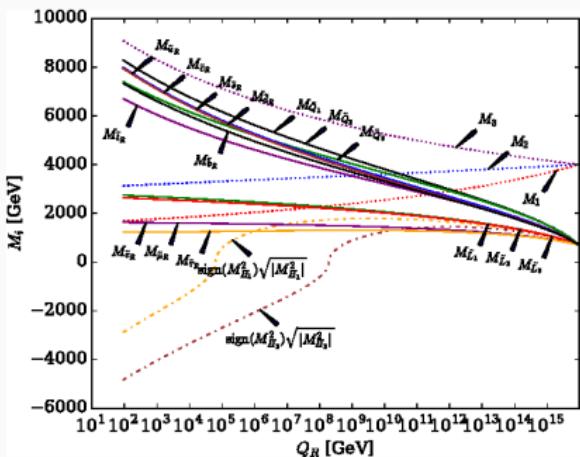

[1312.5250, 1408.4060, 1508.01173]  
[1610.10084, 1610.10084, 1612.05210]

# MSSM scenarios

## GUT Models

### subGUT-CMSSM

$m_0, m_{1/2}, A_0, \tan \beta, M_{in}$

- Reduce impact of LHC by allowing more compressed spectra.

[1711.00458]

# MSSM scenarios

## Phenomenological scenario

- Do not impose a specific structure at the high scale, very large number of parameters.
- Consider “reasonable” assumptions based on current measurements.
- No new sources of CP-violation, no new sources of FCNC, first and second generation universality.
- phenomenological MSSM<sub>n</sub> (pMSSM<sub>n</sub>) where n is the number of parameters [[hep-ph/9901246](#), [hep-ph/0211331](#)].

## pMSSM11

$M_1, M_2, M_3$

$m_{\tilde{q}_{1,2}}, m_{\tilde{q}_3}$

$m_{\tilde{l}_{1,2}}, m_{\tilde{\tau}}$

$A$

$M_A, \tan \beta, \mu$

- Phenomenological model with 11 low-energy input parameters.
- We assume all left and right soft-SUSY mass breaking terms to be equal.
- All the trilinear coupling are the same.

[[1710.11091](#)]

# The framework

---

# The framework

- Frequentist fitting framework written in Python/Cython and C++.
- The Multinest algorithm is used to sample the parameter space.
- udocker also used for deployment .

Parameter	Range	Number of segments
$M_1$	(-4 , 4 ) TeV	6
$M_2$	( 0 , 4 ) TeV	2
$M_3$	(-4 , 4 ) TeV	4
$m_{\tilde{q}}$	( 0 , 4 ) TeV	2
$m_{\tilde{q}_3}$	( 0 , 4 ) TeV	2
$m_{\tilde{l}}$	( 0 , 2 ) TeV	1
$m_{\tilde{\tau}}$	( 0 , 2 ) TeV	1
$M_A$	( 0 , 4 ) TeV	2
$A$	(-5 , 5 ) TeV	1
$\mu$	(-5 , 5 ) TeV	1
$\tan \beta$	( 1 , 60)	1
Total number of boxes		384

## Codes

### Spectrum generation

SoftSUSY

### Higgs sector and $(g - 2)_\mu$

FeynHiggs, HiggsSignals, HiggsBounds

### B-Physics

SuFla, SuperISO

### EW precision observables

FeynWZ

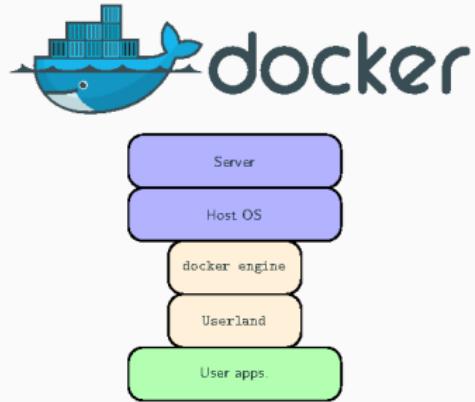

### Dark matter

MicrOMEGAs, SSARD

- Sampled a total of  $2 \times 10^9$  points.
- We thank DESY for the resources provided by the NAF2/BIRD cluster.

# Docker and udocker

- As suggested by the name, udocker uses docker containers.
- Docker: software framework to automatize the deployment of application inside Linux containers.
- Other options, such as LXC, are available to use the Linux container infrastructure.

- Middleware suite developed in the context of the INDIGO data-cloud project to run docker containers in userspace, without requiring root privileges (**both for installation and execution**).

[1711.01758]

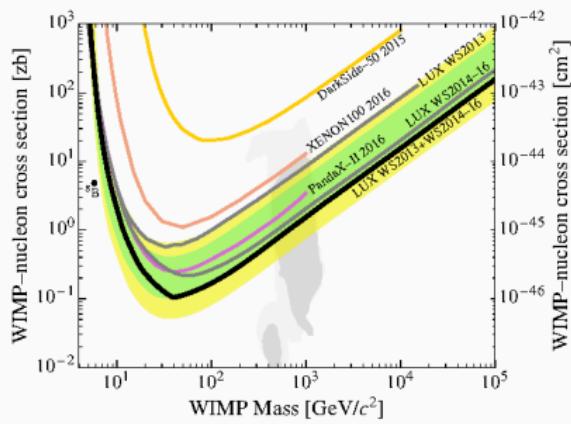

# The constraints

---

# Non-LHC constraints

## Dark matter

- Relic density constraints from Planck.
- Direct detection constraints on  $\sigma_p^{SI}$  from LUX, XENON1T and PANDAX.
- Direct detection constraints on  $\sigma_p^{SD}$  from PIC060.

[1608.07648]

## Flavor observables

- We include  $\text{BR}_{B \rightarrow X_s \ell \bar{\ell}}$ ,  $\text{BR}_{K \rightarrow l \nu}$ ,  $\text{BR}_{B \rightarrow \pi \nu \bar{\nu}}$ ,  $\text{BR}_{B \rightarrow X_s \gamma}$ ,  $\text{BR}_{B \rightarrow \tau \nu}$ ,  $\text{BR}_{B_{s,d} \rightarrow \mu^+ \mu^-}$ ,  $\Delta M_{B_s}$ ,  $\Delta M_{B_s}/\Delta M_{B_d}$ ,  $\epsilon_k$ .

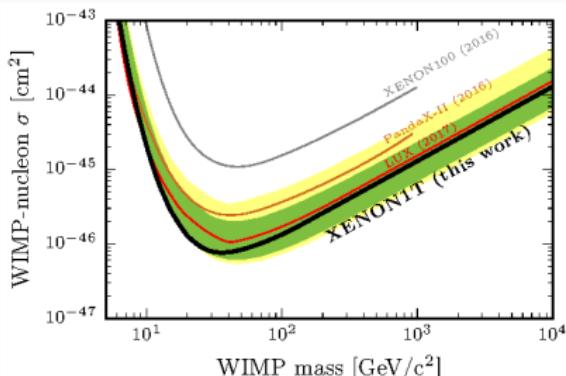

## EWPOs

- Z-pole observables from LEP.
- $M_W$  ( $80.379 \pm 0.012 \pm 0.010$ ), combination with the latest ATLAS results from HEPfit.
- $(g - 2)_\mu$ , whose impact has been investigated in detail.

# Non-LHC constraints

## Dark matter

- Relic density constraints from Planck.
- Direct detection constraints on  $\sigma_p^{SI}$  from LUX, **XENON1T** and PANDAX.
- Direct detection constraints on  $\sigma_p^{SD}$  from PIC060.

[1705.06655]

## Flavor observables

- We include  $\text{BR}_{B \rightarrow X_s \ell \bar{\nu}}$ ,  $\text{BR}_{K \rightarrow \ell \nu}$ ,  
 $\text{BR}_{B \rightarrow \pi \nu \bar{\nu}}$ ,  $\text{BR}_{B \rightarrow X_s \gamma}$ ,  $\text{BR}_{B \rightarrow \tau \nu}$   
 $\text{BR}_{B_{s,d} \rightarrow \mu^+ \mu^-}$ ,  $\Delta M_{B_s}$ ,  
 $\Delta M_{B_s}/\Delta M_{B_d}$ ,  $\epsilon_k$ .

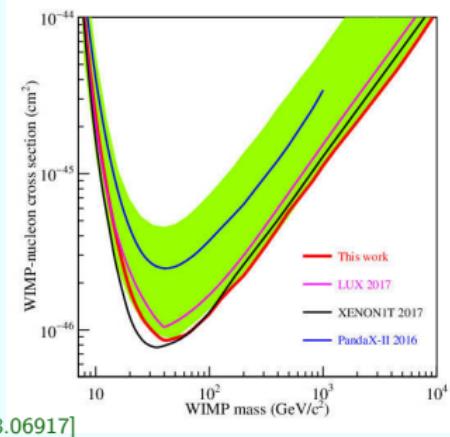

## EWPOs

- Z-pole observables from LEP.
- $M_W$  ( $80.379 \pm 0.012 \pm 0.010$ ), combination with the latest ATLAS results from HEPfit.
- $(g - 2)_\mu$ , whose impact has been investigated in detail.

# Non-LHC constraints

## Dark matter

- Relic density constraints from Planck.
- Direct detection constraints on  $\sigma_p^{SI}$  from LUX, XENON1T and PANDAX.
- Direct detection constraints on  $\sigma_p^{SD}$  from PIC060.

## Flavor observables

- We include  $\text{BR}_{B \rightarrow X_s ll}$ ,  $\text{BR}_{K \rightarrow l\nu}$ ,  $\text{BR}_{B \rightarrow \pi\nu\bar{\nu}}$ ,  $\text{BR}_{B \rightarrow X_s \gamma}$ ,  $\text{BR}_{B \rightarrow \tau\nu}$ ,  $\text{BR}_{B_{s,d} \rightarrow \mu^+ \mu^-}$ ,  $\Delta M_{B_s}$ ,  $\Delta M_{B_s}/\Delta M_{B_d}$ ,  $\epsilon_k$ .

## EWPOs

- Z-pole observables from LEP.
- $M_W$  ( $80.379 \pm 0.012 \pm 0.010$ ), combination with the latest ATLAS results from HEPfit.
- $(g - 2)_\mu$ , whose impact has been investigated in detail.

# LHC13 colored sparticle constraints

## Colored sparticle production

- Production cross-sections computed at NLO+NLL with NLL-Fast, point by point.
- Decays from SDECAY.

## Likelihood modelling

- Fastlim approach.

$$\chi^2_{\tilde{g} \rightarrow \text{SM} \tilde{\chi}_1^0} = 5.99 \cdot \left[ \frac{\sigma_{\tilde{g}\tilde{g}} \text{BR}_{\tilde{g} \rightarrow \text{SM} \tilde{\chi}_1^0}^2}{\sigma_{\text{UL}}^{\tilde{g} \rightarrow \text{SM} \tilde{\chi}_1^0}(m_{\tilde{g}}, m_{\tilde{\chi}_1^0})} \right]^2$$

$$\chi^2_{\tilde{q}_3 \rightarrow \text{SM} \tilde{\chi}_1^0} = 5.99 \cdot \left[ \frac{\sigma_{\tilde{q}_3 \tilde{q}_3} \text{BR}_{\tilde{q}_3 \rightarrow \text{SM} \tilde{\chi}_1^0}^2}{\sigma_{\text{UL}}^{\tilde{q}_3 \rightarrow \text{SM} \tilde{\chi}_1^0}(m_{\tilde{t}_1}, m_{\tilde{\chi}_1^0})} \right]^2$$

Topology	Analysis	Ref.
$\tilde{g}\tilde{g} \rightarrow [q\bar{q}\tilde{\chi}_1^0]^2, [b\bar{b}\tilde{\chi}_1^0]^2$	0 leptons + jets with $\cancel{E}_T$	[CMS-SUS-16-036, 1705.04650]
$\tilde{g}\tilde{g} \rightarrow [\tilde{t}\tilde{t}\tilde{\chi}_1^0]^2$	1 lepton + jets with $\cancel{E}_T$	[CMS-SUS-16-037, 1705.04673]
$\tilde{q}\tilde{\bar{q}} \rightarrow [q\tilde{\chi}_1^0][\bar{q}\tilde{\chi}_1^0]$	0 leptons + jets with $\cancel{E}_T$	[CMS-SUS-16-036, 1705.04650]
$\tilde{b}\tilde{\bar{b}} \rightarrow [b\tilde{\chi}_1^0][\bar{b}\tilde{\chi}_1^0]$	0 leptons + jets with $\cancel{E}_T$	[CMS-SUS-16-036, 1705.04650]
$\tilde{t}_1\tilde{\bar{t}}_1 \rightarrow [t\tilde{\chi}_1^0][\bar{t}\tilde{\chi}_1^0], [c\tilde{\chi}_1^0][\bar{c}\tilde{\chi}_1^0]$	0 leptons + jets with $\cancel{E}_T$	[CMS-SUS-16-036, 1705.04650]
$\tilde{t}_1\tilde{\bar{t}}_1 \rightarrow [\bar{b}\tilde{\chi}_1^{\pm}][\bar{b}\tilde{\chi}_1^{\mp}] \rightarrow [\bar{b}W^+\tilde{\chi}_1^0][\bar{b}W^-\tilde{\chi}_1^0]$	0 leptons + jets with $\cancel{E}_T$	[CMS-SUS-16-036, 1705.04650]

# LHC13 EWKinos constraints

## EWKino production

- Production cross-sections computed at NLO with EWK-fast, point by point.
- New code from Bagnaschi, Papucci, Sakurai, Weiler and Zeune, soon to be released.

$$\begin{aligned}\sigma(pp \rightarrow \tilde{\chi}_i \tilde{\chi}_j) \\ = \sum_a T_a(\mathcal{U}) F_a(m_{\tilde{\chi}_i}, m_{\tilde{\chi}_j}, m_a)\end{aligned}$$

## Likelihood modelling

- Fastlim approach.

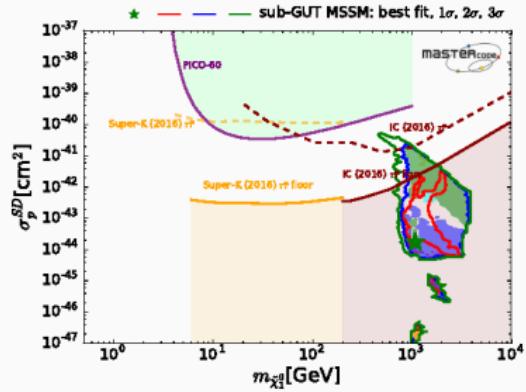

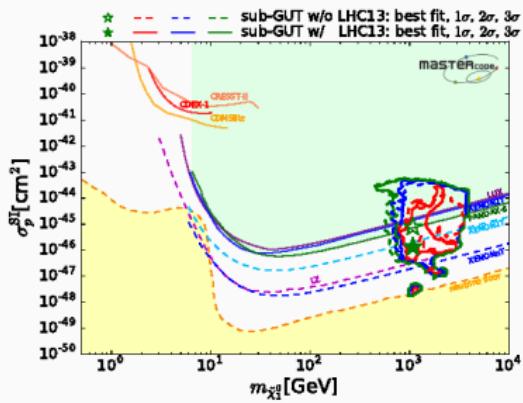

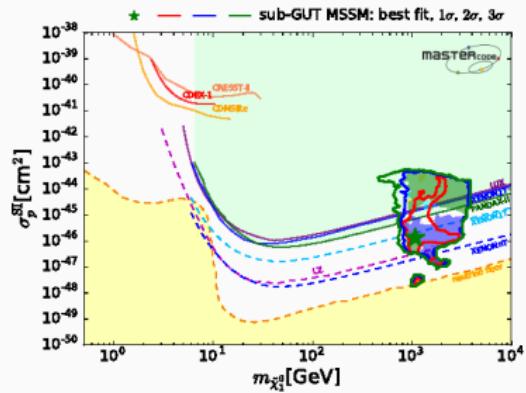

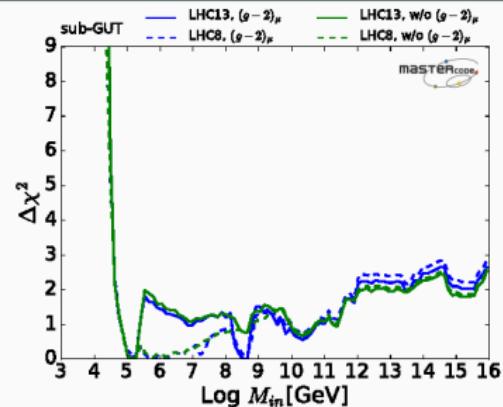

$$5.99 \cdot \left[ \frac{\sigma_{\tilde{\chi}_1^\pm \tilde{\chi}_2^0 \rightarrow \text{SM} \tilde{\chi}_1^0, \tilde{\chi}_2^0 \rightarrow \text{SM} \tilde{\chi}_1^0}^{\text{BR}}}{\sigma_{\text{UL}}^{\tilde{\chi}_1^\pm \rightarrow \text{SM} \tilde{\chi}_1^0} (\tilde{\chi}_2^0 \rightarrow \text{SM} \tilde{\chi}_1^0)} \right]^2$$

Topology	Analysis	Ref.
$\tilde{\chi}_1^\pm \tilde{\chi}_2^0 \rightarrow [\nu \ell^\pm \tilde{\chi}_1^0][\ell^+ \ell^- \tilde{\chi}_1^0]$ (via $\tilde{\ell}^\pm$ )	multileptons with $\cancel{E}_T$	[CMS-SUS-16-039, 1709.05406]
$\tilde{\chi}_1^\pm \tilde{\chi}_2^0 \rightarrow [\nu \tau^\pm \tilde{\chi}_1^0][\tau^+ \tau^- \tilde{\chi}_1^0]$ (via $\tilde{\tau}^\pm$ )	multileptons with $\cancel{E}_T$	[CMS-SUS-16-039, 1709.05406]
$\tilde{\chi}_1^\pm \tilde{\chi}_2^0 \rightarrow [W^\pm \tilde{\chi}_1^0][Z \tilde{\chi}_1^0]$	multileptons with $\cancel{E}_T$	[CMS-SUS-16-039, 1709.05406]

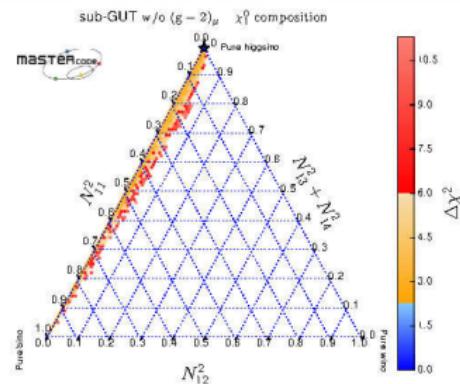

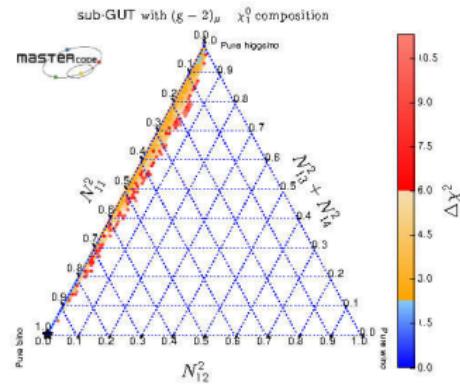

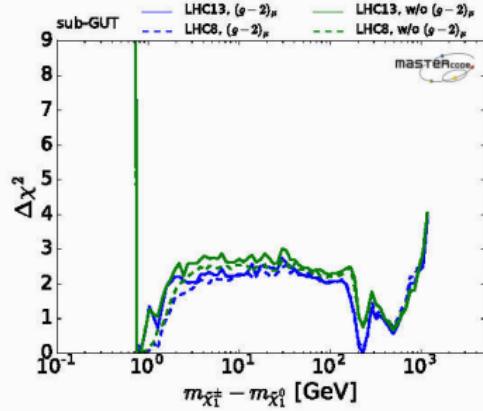

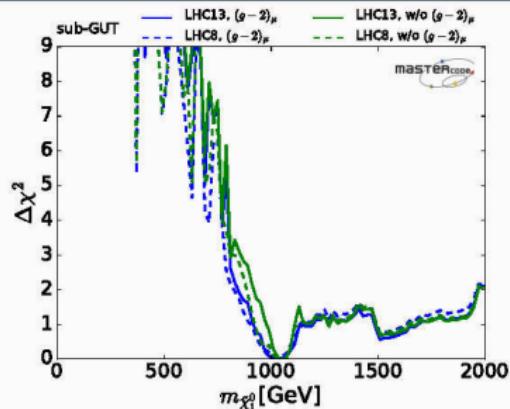

# **subGUT-CMSSM**

---

# Parameter Input-scale dependence

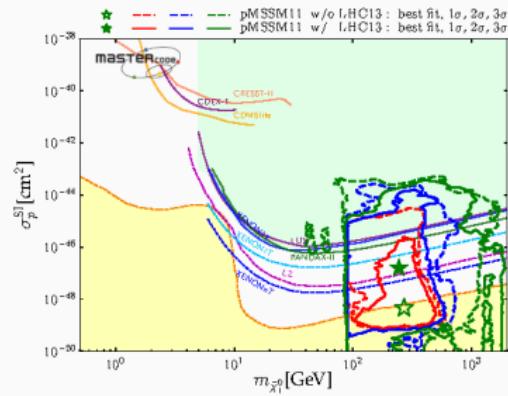

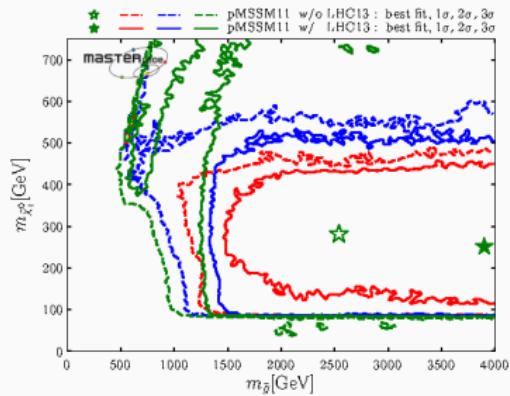

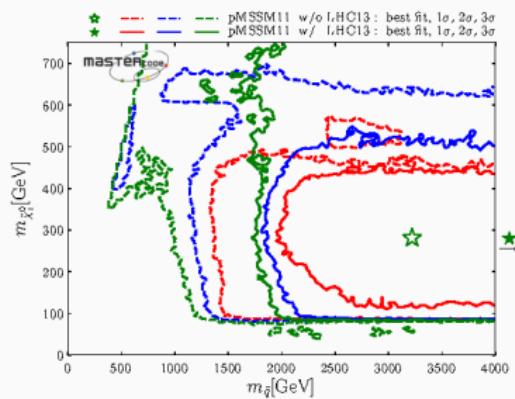

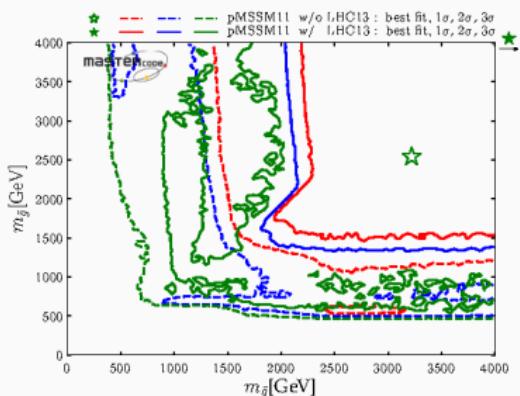

# Colored sparticle mass range

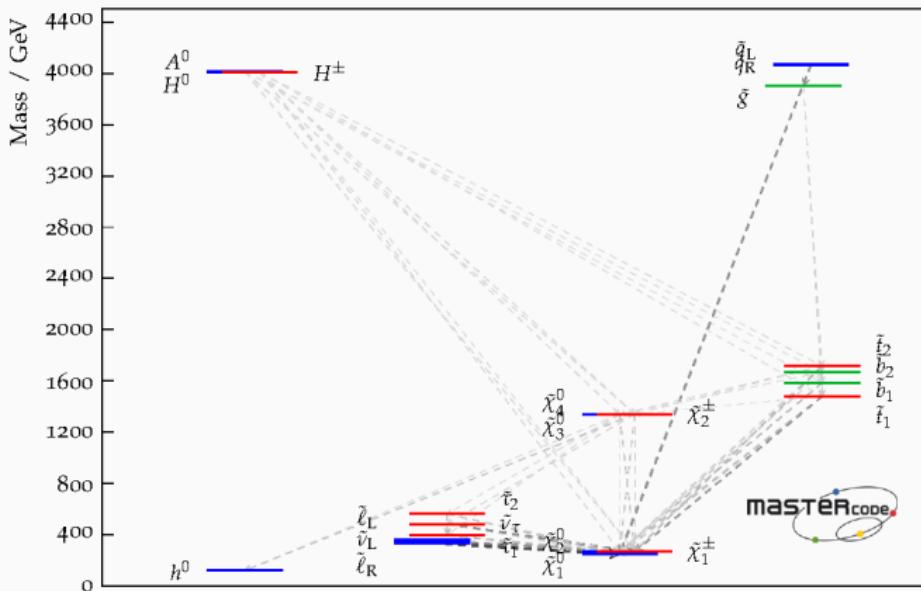

# pMSSM11

---

# From 2015 to 2017 (LHC+DD)

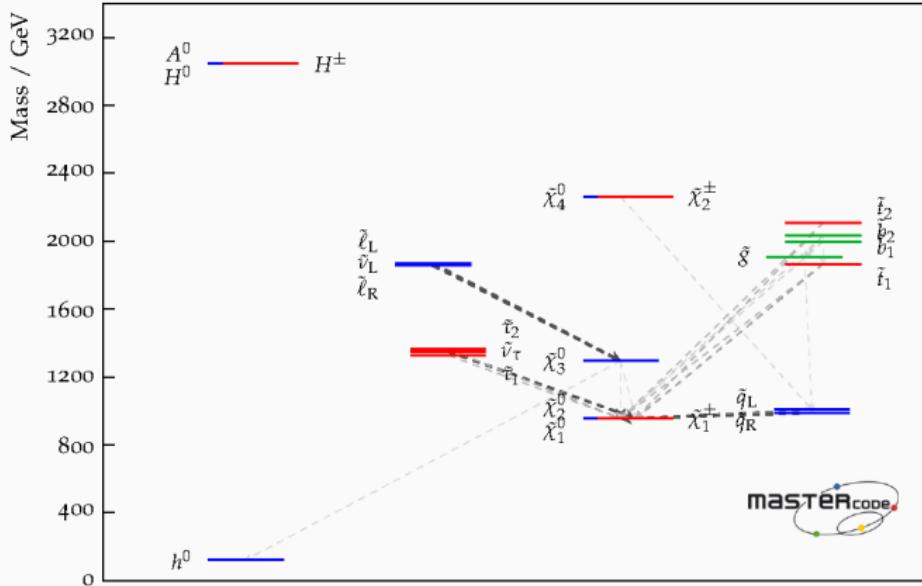

# pMSSM11 best fit point

Parameter	Best-fit
$M_1$	250 GeV
$M_2$	250 GeV
$M_3$	3.86 TeV
$m_{\tilde{q}}$	4 TeV
$m_{\tilde{q}_3}$	1.7 TeV
$m_{\tilde{l}}$	350 GeV
$m_{\tilde{\tau}}$	460 GeV
$M_A$	4 TeV
$A$	2.8 TeV
$\mu$	1.33 TeV
$\tan \beta$	36

- Heavy Higgses, squarks, gluinos are relatively unconstrained.
- Left-handed fermion decay chains evolve via  $\tilde{\chi}_1^\pm$  and  $\tilde{\chi}_2^\pm$ .
- Sleptons are at less than 1 TeV.

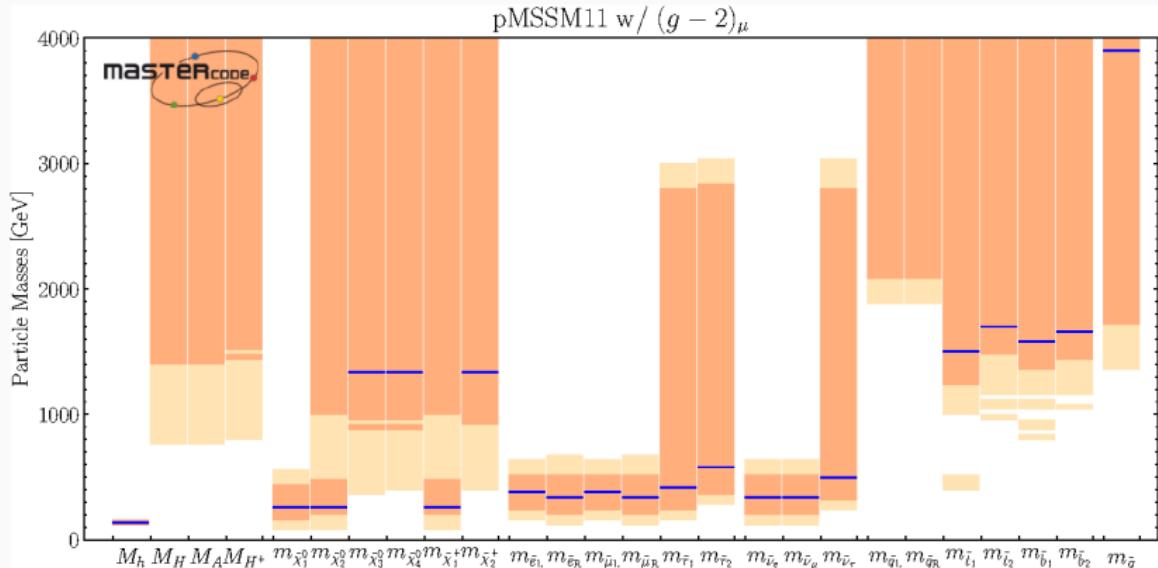

# pMSSM11 best fit point w/o $(g - 2)_\mu$

Parameter	Best-fit
$M_1$	-1.3 TeV
$M_2$	2.3 TeV
$M_3$	1.9 TeV
$m_{\tilde{q}}$	0.9 TeV
$m_{\tilde{q}_3}$	2.0 TeV
$m_{\tilde{t}_1}$	1.9 TeV
$m_{\tilde{\tau}}$	1.3 TeV
$M_A$	3.0 TeV
$A$	-3.4 TeV
$\mu$	-0.95 TeV
$\tan \beta$	33

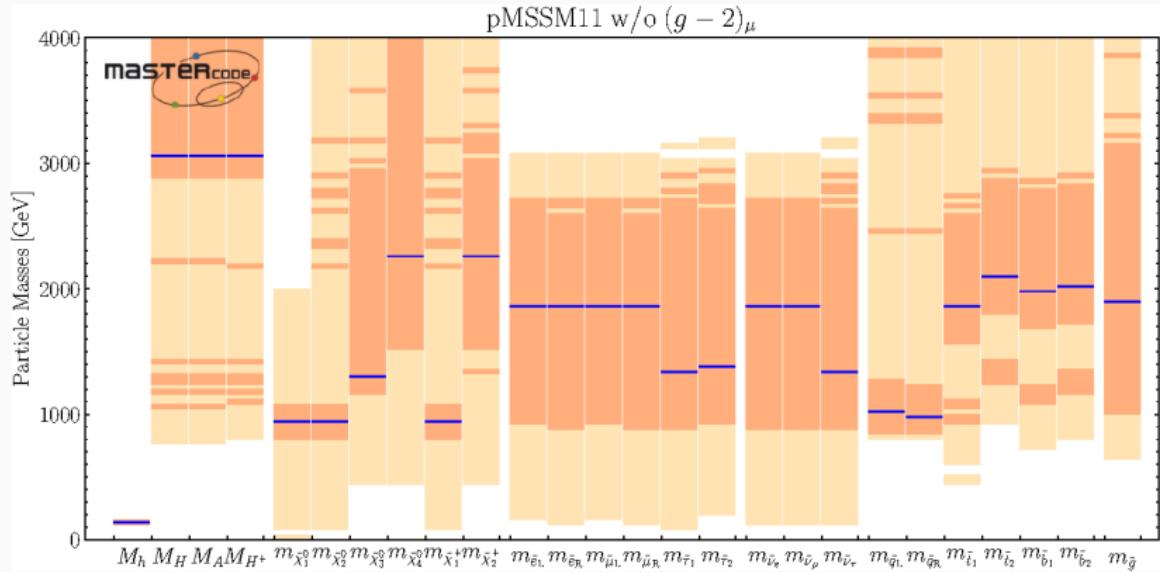

- Neutralino is Higgsino-like, at around 1 TeV.
- Heavier spectrum, with first two generation squarks around 1 TeV.

# pMSSM11 mass spectrum

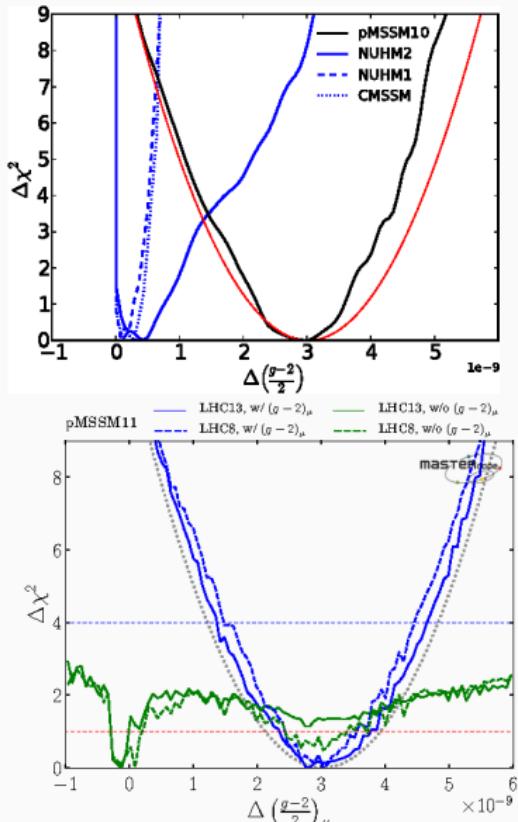

- Poor determination of the mass of colored sparticles (only lower bound from LHC searches).
- Larger freedom allow to fulfill the  $(g - 2)_\mu$  constraint without being in tension with the LHC searches.
- Improved fit with respect to the GUT models.

# pMSSM11 mass spectrum w/o $(g - 2)_\mu$

- Poor determination of the mass of colored sparticles (only lower bound from LHC searches).
- Reduced parameter range at 68% CL because of slightly improved fit of flavor observables.

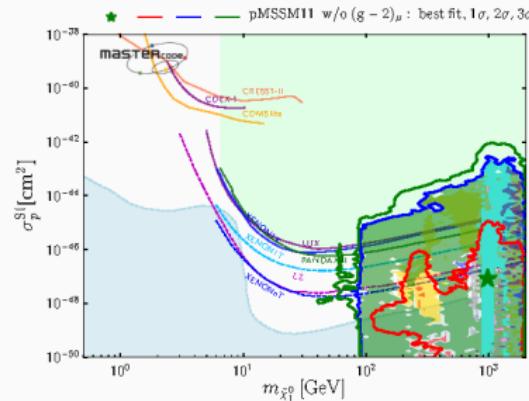

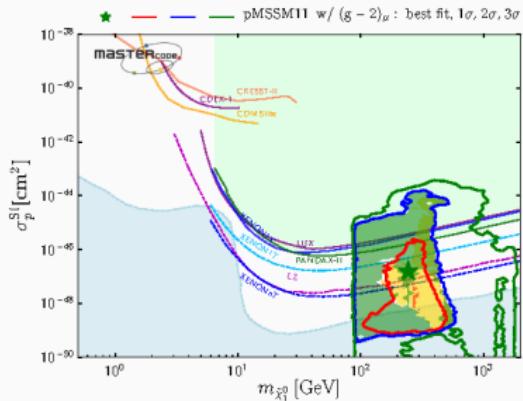

# The $(g - 2)_\mu$ constraint

Model	$\chi^2/n_{\text{dof}}$	$\chi^2$ probability
CMSSM	32.8/24	11 %
NUHM1	31.1/23	12 %
NUHM2	30.3/22	11 %
pMSSM10	20.5/18	31 %
pMSSM11	22.21/20	33 %
pMSSM11	20.88/19	34 %
w/o $(g-2)_\mu$		

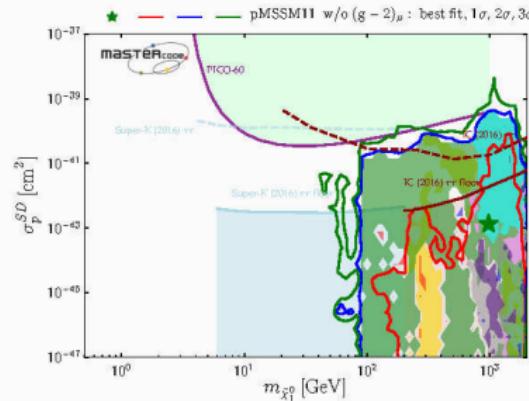

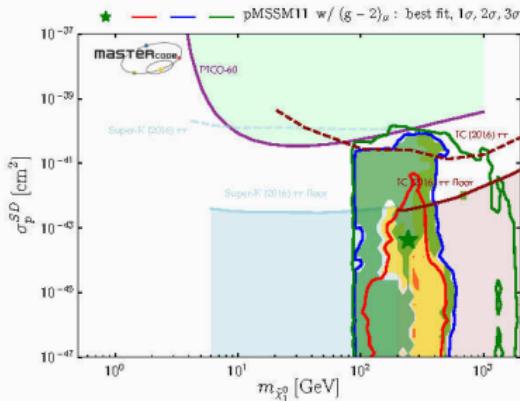

- $\simeq 3.5 \sigma$  discrepancy between the SM  $(g - 2)_\mu$  value and the measured one.
- In the GUT scenarios there is a tension between the  $(g - 2)_\mu$  and LHC constraint.
- In the pMSSM it is possible to fit  $(g - 2)_\mu$ .

# Spin-independent scattering cross-section

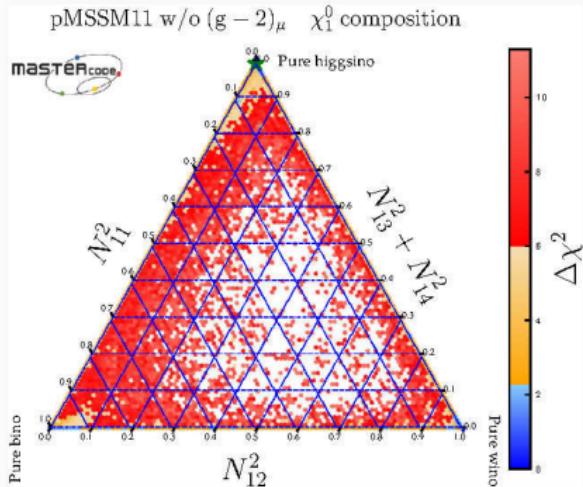

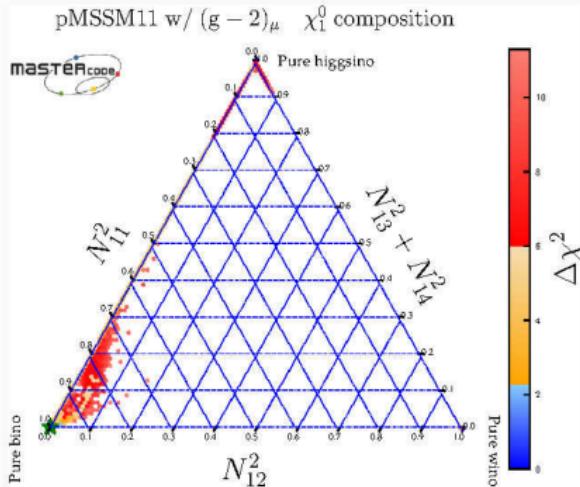

- Complementarity of collider searches vs direct-detection searches.
- Relieving  $(g-2)_\mu$  allows for light higgs funnel/Z funnel/t-channel-stau regions to appear at the  $2\sigma$  and  $3\sigma$  level.

# Spin-dependent scattering cross-section

- PICO-60 results touch the  $3\sigma$  contours.
- We cross-checked for a selection of points that IC constraints are relevant only for a minority of points in our sample.

# $\tilde{\chi}_1^0$ composition

- Bi-component/pure neutralinos always preferred.
- $(g - 2)_\mu$  implies preference for Bino, Bino-Higgsino.

# Conclusions

---

# Conclusions

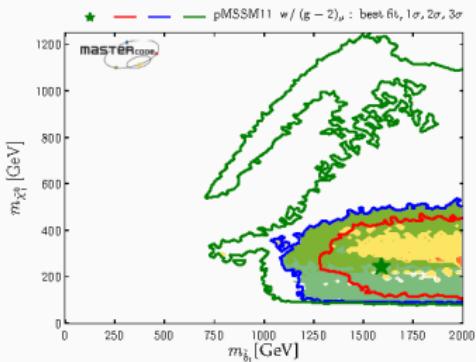

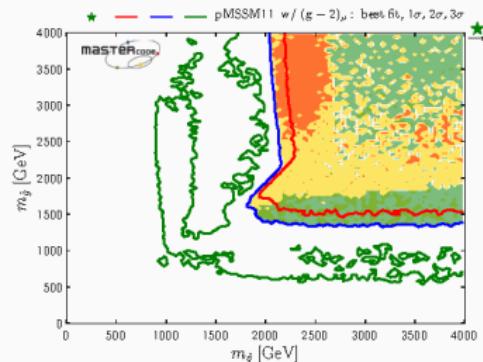

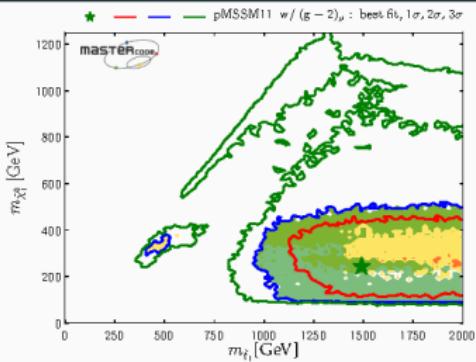

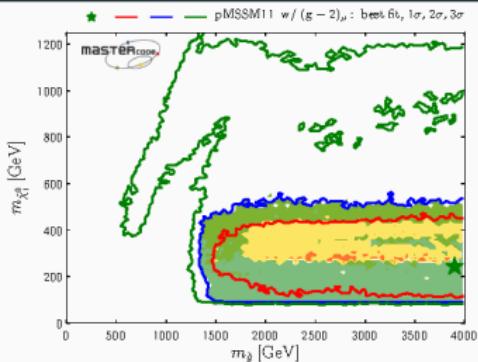

- We performed what is the first global likelihood analysis of the pMSSM11 and the subGUT-CMSSM using a frequentist approach including all the relevant  $36 \text{ fb}^{-1}$  constraints.
- In the case of the pMSSM11, The new results from LHC @ 13 TeV and from direct-dection DM experiments exerts a significant impact on the allowed parameter range.
- We studied in depth the interplay between  $(g - 2)_\mu$  and flavor constraints. Significant change in the phenomenology when relieving  $(g - 2)_\mu$ .
- In the pMSSM11, still relatively low masses for sparticles appear to be allowed and in part will be probed by the future runs of the LHC.
- Looking *forward* to improve our constraint sets and to study new SUSY and non-SUSY scenarios.

A/H funnel	stau coann.	squark coann.	sbottom coann.

# Nose regions

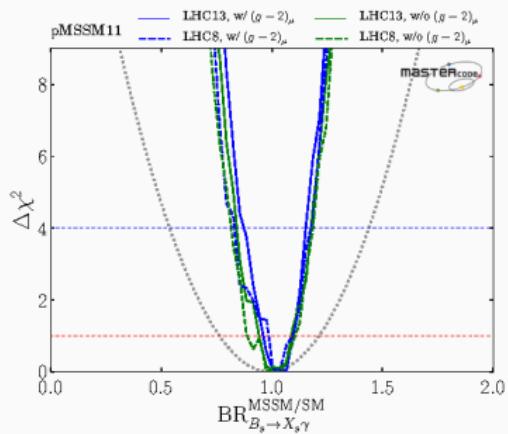

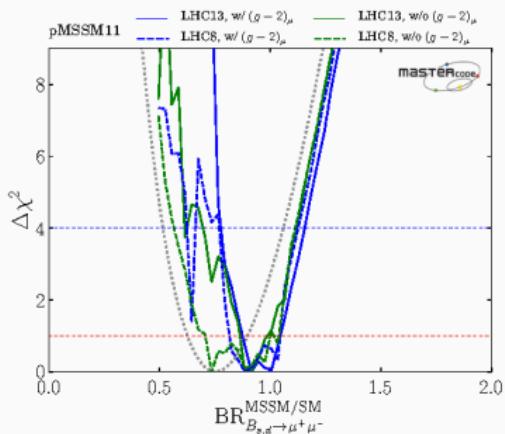

- Loss of search sensitivity when  $\tilde{q}_R \rightarrow \tilde{g} + q$ , the  $q$  jet is soft, and  $\tilde{g} \rightarrow q\bar{q} + \tilde{\chi}^*$  compared to a high sensitivity for  $\tilde{q}_R \rightarrow q\tilde{\chi}_1^0$  in the  $m_{\tilde{g}} > m_{\tilde{q}}$  case.
- Heavy neutralino allows for more compressed spectra, which reduced the efficiency of experimental searches.

# Higgs decays

- At 68%CL no significant deviation from the SM, as expected.

# Flavor constraints

- Removing the  $(g - 2)_\mu$  allows for an improved fit of  $B_{s,d} \rightarrow \mu^+\mu^-$ .

# Long lived staus and charginos
