Abstract

We calculate the unpolarized and polarized two-loop massless off-shell operator matrix elements in QCD to $O(\varepsilon)$ in the dimensional parameter in an automated way. Here we use the method of arbitrary high Mellin moments and difference ring theory, based on integration-by-parts relations. This method also constitutes one way to compute the QCD anomalous dimensions. The presented higher order contributions to these operator matrix elements occur as building blocks in the corresponding higher order calculations up to four-loop order. All contributing quantities can be expressed in terms of harmonic sums in Mellin- N space or by harmonic polylogarithms in z -space. We also perform comparisons to the literature.

1. Introduction

The unpolarized and polarized anomalous dimensions of the local twist-2 operators in Quantum Chromodynamics (QCD) play a fundamental role in the description of the scaling violations of the deep-inelastic structure functions. Their measurement provides one of the safest ways to measure the strong coupling constant $\alpha_s(M_Z^2) = 4\pi a_s$ [1]. While at first order, there is a wide

variety of possibilities to calculate the anomalous dimensions, see e.g. [2], at higher orders only a few efficient methods are known. These are based either on the calculation of massless off-shell operator matrix elements (OMEs) [3–20], the calculation of the forward Compton amplitude of a space-like virtual gauge boson on a massless on-shell parton [21–25] and on massive on-shell OMEs [26–41]. All these methods have advantages and disadvantages and form complimentary ways to compute the anomalous dimensions.

To perform phenomenological analyses of the deep-inelastic world data also the process dependent massless and massive Wilson coefficients have to be calculated [21,26,33,39,41–70]. This is also necessary to account for the specific scaling violations implied by massive quarks, such as charm and bottom.

In this paper we present the results for the unpolarized and polarized massless off-shell OMEs up to two-loop order and to corrections of $O(\varepsilon)$ (at $O(a_s)$ of $O(\varepsilon^2)$), with the dimensional parameter $\varepsilon = D - 4$, including non-gauge invariant contributions. A part of these expansion coefficients of the various OMEs contribute to the physical OMEs up to four-loop order. Others emerge due to the kinematic breaking of gauge invariance both in the unpolarized and polarized off-shell case. One characteristic is the emergence of additional OMEs related to the breaking of the equation of motion (eom) and of new non-gauge invariant OMEs, also with new unphysical anomalous dimensions. These quantities play a role in the calculation of the unpolarized anomalous dimensions due to mixing. We extend earlier work of Refs. [19,20] and perform the calculation in an automated way, applying methods which have been developed by us solving a series of massive three-loop problems and other applications during the last decade.

The theoretical basis for these calculations has been laid out in a series of papers describing the situation holding in the off-shell case, breaking gauge invariance, cf. [4,15,19,20,71–78]. Compared to the method of the forward Compton amplitude, the method of massless off-shell OMEs needs no precautions as reference to Higgs and gravitational subsidiary fields. The use of massive on-shell OMEs, as also the method of the forward Compton amplitude do not encounter gauge invariance problems, on the other hand. However, the massive OMEs allow to derive only the contributions $\propto T_F$ of the anomalous dimensions, except of going to one order higher in the coupling constant. A new challenge in the present approach is to master the breaking of gauge invariance to the respective perturbative order. We present the results in Mellin- N space, because the expressions are more compact than in momentum fraction z space. We also perform a detailed comparison to the literature [15,19,20,79] and correct results given there, including Feynman rules, and also all non-gauge invariant terms. A by-product of the present calculation is the calculation of the (by now well-known) unpolarized physical anomalous dimensions to two-loop order. We present all contributing expansion coefficients up to $O(a_s^2)$ to the depth being needed in future four-loop calculations, extending the level previously attempted in Refs. [19,20].

The paper is organized as follows. In Section 2 we give a brief outline of the formalism, including the renormalization, and the main steps of the calculation of the different off-shell OMEs. We then turn to the calculation of the OMEs of the so-called alien operators in Section 3, which also lead to additional anomalous dimensions. These operator matrix elements contribute via mixing to the renormalization of the unpolarized singlet operators, which we discuss in Section 4. In Sections 5–7 we present the expansion coefficients of the unpolarized and the polarized standard OMEs and those for transversity for non-negative powers in the dimensional parameter ε . In Section 8 we compare to and correct partial results given previously in Refs. [19,20]. Section 9 contains the conclusions. In Appendix A we provide Feynman rules for the alien operators, if not previously being presented in Refs. [38,80,81], and list the contributing polynomials appearing in the standard OMEs in Appendix B. Our results both in Mellin- N space and z -space,

are given in ancillary files in computer-readable form. In z -space we use the decomposition given in [82], Eqs. (45,46).

2. The formalism

The massless off-shell OMEs are defined by

$$\hat{A}_{ij}^l = \langle j(p) | O_i^l | j(p) \rangle, \quad \text{with } i, j = q, g, \quad (1)$$

where l further labels the type of the OME and p denotes the off-shell momentum with $p^2 < 0$. The twist-2 local physical operators¹ are given by

$$O_{q,r;\mu_1 \dots \mu_N}^{\text{NS}} = i^{N-1} \mathbf{S} \left[\bar{\psi} \gamma_{\mu_1} D_{\mu_2} \dots D_{\mu_N} \frac{\lambda_r}{2} \psi \right] - \text{trace terms}, \quad (2)$$

$$O_{q;\mu_1 \dots \mu_N}^{\text{S}} = i^{N-1} \mathbf{S} \left[\bar{\psi} \gamma_{\mu_1} D_{\mu_2} \dots D_{\mu_N} \psi \right] - \text{trace terms}, \quad (3)$$

$$O_{g;\mu_1 \dots \mu_N}^{\text{S}} = 2i^{N-2} \mathbf{SSp} \left[F_{\mu_1 \alpha}^a D_{\mu_2} \dots D_{\mu_{N-1}} F_{\mu_N}^{\alpha, a} \right] - \text{trace terms}, \quad (4)$$

in the unpolarized case. In the polarized case the operators are

$$O_{q,r;\mu_1 \dots \mu_N}^{\text{NS}} = i^{N-1} \mathbf{S} \left[\bar{\psi} \gamma_5 \gamma_{\mu_1} D_{\mu_2} \dots D_{\mu_N} \frac{\lambda_r}{2} \psi \right] - \text{trace terms}, \quad (5)$$

$$O_{q;\mu_1 \dots \mu_N}^{\text{S}} = i^{N-1} \mathbf{S} \left[\bar{\psi} \gamma_5 \gamma_{\mu_1} D_{\mu_2} \dots D_{\mu_N} \psi \right] - \text{trace terms}, \quad (6)$$

$$O_{g;\mu_1 \dots \mu_N}^{\text{S}} = 2i^{N-2} \mathbf{SSp} \left[\frac{1}{2} \varepsilon_{\mu_1 \alpha \beta \gamma} F^{\beta \gamma, a} D_{\mu_2} \dots D_{\mu_{N-1}} F_{\mu_N}^{\alpha, a} \right] - \text{trace terms}. \quad (7)$$

For transversity [83] the following local non-singlet operator contributes

$$O_{q,r;\mu\mu_1 \dots \mu_N}^{\text{NS}} = i^{N-1} \mathbf{S} \left[\bar{\psi} \sigma_{\mu\mu_1} D_{\mu_2} \dots D_{\mu_N} \frac{\lambda_r}{2} \psi \right] - \text{trace terms}, \quad (8)$$

where $\sigma_{\mu\nu} = (i/2)[\gamma_\mu \gamma_\nu - \gamma_\nu \gamma_\mu]$. Here Δ denotes a light-like vector, $\Delta \cdot \Delta = 0$. ψ denotes the quark field, λ_r , $r \in [1, N_F^2 - 1]$ the $SU(N_F)$ matrices, γ_μ a Dirac matrix, D_μ the covariant derivative and A_ν^a the gluon fields, with $F_{\mu\nu}^a$ the gluonic field strength tensor and $\varepsilon_{\alpha\beta\gamma\delta}$ the Levi-Civita pseudo-tensor. For further notations we refer to Ref. [82].

Furthermore, the relative normalization between the quark-singlet and gluon external states has to be fixed. We adopt the same convention as in the massive on-shell case [80] by demanding 4-momentum conservation

$$\int_0^1 dx x [\Sigma(x) + G(x)] = 1, \quad (9)$$

¹ The unphysical local operators are defined in Section 3 below.

where Σ is the quark singlet distribution

$$\Sigma(x) = \sum_{k=1}^{N_F} [q_k(x) + \bar{q}_k(x)], \quad (10)$$

with q the quark, $\bar{q}$ the antiquark distributions and G is the gluon distribution. In this way the operators are also fixed in the polarized case, replacing γ_μ by $\gamma_\mu \gamma_5$, etc., cf. [81].

We apply the following projectors to determine the different contributions to the OMEs. For external quark fields one uses in the unpolarized case

$$\hat{A}_{iq} = \left[\not{X} \hat{A}_{iq}^{\text{phys}} + \not{p} \frac{\Delta \cdot p}{p^2} \hat{A}_{iq}^{\text{eom}} \right] (\Delta \cdot p)^{N-1}, \quad i = q, g. \quad (11)$$

The quarkonic projections are obtained by

$$\hat{A}_{iq}^{\text{phys}} = \frac{1}{4(\Delta \cdot p)^N} \text{tr} \left[\left(\not{p} - \frac{p^2}{\Delta \cdot p} \not{X} \right) \hat{A}_{iq} \right] \quad (12)$$

$$\hat{A}_{iq}^{\text{eom}} = \frac{1}{(4\Delta \cdot p)^N} \text{tr} \left[\not{X} \hat{A}_{iq} \right]. \quad (13)$$

For external gluons the decomposition is as follows [19]

$$\hat{A}_{ig,\mu\nu} = \hat{A}_{ig}^{\text{phys}} T_{\mu\nu}^{(1)} + \hat{A}_{ig}^{\text{eom}} T_{\mu\nu}^{(2)} + \hat{A}_{ig}^{\text{ngi}} T_{\mu\nu}^{(3)}, \quad (14)$$

where

$$T_{\mu\nu}^{(1)} = \frac{1}{2} [1 + (-1)^N] \left[g_{\mu\nu} - \frac{p_\mu \Delta_\nu + \Delta_\mu p_\nu}{\Delta \cdot p} + \frac{\Delta_\mu \Delta_\nu p^2}{(\Delta \cdot p)^2} \right] (\Delta \cdot p)^N, \quad (15)$$

$$T_{\mu\nu}^{(2)} = \frac{1}{2} [1 + (-1)^N] \left[\frac{p_\mu p_\nu}{p^2} - \frac{p_\mu \Delta_\nu + \Delta_\mu p_\nu}{\Delta \cdot p} + \frac{\Delta_\mu \Delta_\nu p^2}{(\Delta \cdot p)^2} \right] (\Delta \cdot p)^N, \quad (16)$$

$$T_{\mu\nu}^{(3)} = \frac{1}{2} [1 + (-1)^N] \left[-\frac{p_\mu \Delta_\nu + \Delta_\mu p_\nu}{2\Delta \cdot p} + \frac{\Delta_\mu \Delta_\nu p^2}{(\Delta \cdot p)^2} \right] (\Delta \cdot p)^N. \quad (17)$$

Later one more tensor structure is needed

$$T_{\mu\nu}^{(4)} = \frac{1}{2} [1 + (-1)^N] \left[\frac{p_\mu \Delta_\nu + \Delta_\mu p_\nu}{2\Delta \cdot p} \right] (\Delta \cdot p)^N, \quad (18)$$

with [19]

$$\begin{aligned} p^\mu T_{\mu\nu}^{(i)} &= 0, & (i = 1, 2), & & p^\mu T_{\mu\nu}^{(i)} &\neq 0, & (i = 3, 4) \\ p^\mu p^\nu T_{\mu\nu}^{(i)} &= 0, & (i = 1, 2, 3), & & p^\mu p^\nu T_{\mu\nu}^{(4)} &\neq 0. \end{aligned} \quad (19)$$

This tensor decomposition implies the choice of a physical gauge for the external gluon lines, with a propagator

$$D^{\mu\nu}(k^2) = i \frac{d^{\mu\nu}(k)}{k^2 + i0}, \quad d_{\mu\nu}(k) = -g^{\mu\nu} - n^2 \frac{k^\mu k^\nu}{(k \cdot n)^2} + \frac{n^\mu k^\nu + n^\nu k^\mu}{k \cdot n}, \quad (20)$$

and $n^2 \leq 0$.

The resulting Ward identities are

$$p^\mu \hat{A}_{qg,\mu\nu} = \frac{1}{2} [1 + (-1)^N] \left[-p_\nu + \frac{\Delta_\nu p^2}{\Delta \cdot p} \right] (\Delta \cdot p)^N \hat{A}_{qg}^{\text{ngi}}, \quad (21)$$

$$p^\mu p^\nu \hat{A}_{qg,\mu\nu} = 0. \quad (22)$$

The gluonic projections are given by

$$\hat{A}_{ig}^{\text{phys}} = \frac{1}{D-2} \left[g_{\mu\nu} + \frac{p^2}{(\Delta \cdot p)^2} \Delta_\mu \Delta_\nu - \frac{p_\mu \Delta_\nu + p_\nu \Delta_\mu}{\Delta \cdot p} \right] \hat{A}_{ig}^{\mu\nu}, \quad (23)$$

$$\hat{A}_{ig}^{\text{eom}} = \frac{p^2}{(\Delta \cdot p)^2} \Delta_\mu \Delta_\nu \hat{A}_{ig}^{\mu\nu}, \quad (24)$$

$$\hat{A}_{ig}^{\text{ngi}} = \left[\frac{p_\mu p_\nu}{4p^2} - \frac{p_\mu \Delta_\nu + p_\nu \Delta_\mu}{2\Delta \cdot p} \right] \hat{A}_{ig}^{\mu\nu}, \quad (25)$$

$$\hat{A}_{ig}^{\text{wi}} = \frac{p_\mu p_\nu}{4p^2} \hat{A}_{ig}^{\mu\nu}. \quad (26)$$

In the polarized case the OMEs $\Delta \hat{A}_{iq}^1$, $i = q, g$ are given by

$$\Delta \hat{A}_{iq} = \left[\gamma_5 \not{\Delta} \Delta \hat{A}_{iq}^{\text{phys}} + \gamma_5 \not{p} \frac{\Delta \cdot p}{p^2} \Delta \hat{A}_{iq}^{\text{eom}} \right] (\Delta \cdot p)^{N-1}, \quad (27)$$

and the OMEs with external gluon lines read

$$\Delta \hat{A}_{ig,\mu\nu} = \varepsilon_{\mu\nu\alpha\beta} \frac{\Delta^\alpha p^\beta}{\Delta \cdot p} \Delta \hat{A}_{ig}^{\text{phys}}, \quad i = q, g. \quad (28)$$

To treat γ_5 in $D = 4 + \varepsilon$ dimensions we use the Larin scheme [20,86] and perform the replacement

$$\not{p} \gamma_5 = \frac{i}{6} \varepsilon_{\mu\nu\rho\sigma} p^\mu \gamma^\nu \gamma^\rho \gamma^\sigma, \quad (29)$$

while contracting the occurring ϵ -tensors in D dimensions using

$$\varepsilon_{\mu\nu\rho\sigma} \varepsilon^{\alpha\lambda\tau\gamma} = -\text{Det}[g_\omega^\beta], \quad \beta = \alpha, \lambda, \tau, \gamma; \quad \omega = \mu, \nu, \rho, \sigma. \quad (30)$$

In this scheme the projections onto the different terms are given by

$$\begin{aligned} \Delta \hat{A}_{iq}^{\text{phys}} &= -\frac{1}{4(D-2)(D-3)} \varepsilon_{\mu\nu\rho\sigma} p^\rho \Delta^\sigma \text{tr} \left[\not{p} \gamma^\mu \gamma^\nu \Delta \hat{A}_{iq} \right] (\Delta \cdot p)^{-N-1} \\ &\quad - \frac{p^2}{4(D-2)(D-3)} \varepsilon_{\mu\nu\rho\sigma} p^\rho \Delta^\sigma \text{tr} \left[\not{\Delta} \gamma^\mu \gamma^\nu \Delta \hat{A}_{iq} \right] (\Delta \cdot p)^{-N-2}, \end{aligned} \quad (31)$$

$$\Delta \hat{A}_{iq}^{\text{eom}} = \frac{p^2}{4(D-2)(D-3)} \varepsilon_{\mu\nu\rho\sigma} p^\rho \Delta^\sigma \text{tr} \left[\not{\Delta} \gamma^\mu \gamma^\nu \Delta \hat{A}_{iq} \right] (\Delta \cdot p)^{-N-2}, \quad (32)$$

$$\Delta \hat{A}_{ig}^{\text{phys}} = \frac{1}{(D-2)(D-3)} \varepsilon_{\mu\nu\rho\sigma} \Delta^\rho p^\sigma (\Delta \cdot p)^{-N-1} \Delta \hat{A}_{ig}^{\mu\nu}. \quad (33)$$

There is no mixing between the physical and the ngi and the alien operators, because no symmetric rank two tensor contributes.

For transversity the tensor decomposition for the OME reads

$$\hat{A}_{qq,\mu}^{\text{NS,tr}} = \Delta^\rho \sigma_{\mu\rho} \tilde{A}_{qq}^{\text{NS,tr}} + c_1 \Delta_\mu + c_2 p_\mu + c_3 \gamma_\mu \not{p} + c_4 \Delta_\mu \not{\Delta} \not{p} + c_5 p_\mu \not{\Delta} \not{p}. \quad (34)$$

The physical OME can be extracted using the following projector

$$\tilde{A}_{qq}^{\text{NS,tr}} = \frac{i}{4(D-2)} \text{tr} \left[\left(-p^\mu \not{\Delta} \not{p} + \Delta \cdot p \gamma^\mu \not{p} + i p^2 \Delta_\rho \sigma^{\mu\rho} \right) \hat{A}_{qq,\mu}^{\text{NS,tr}} \right] (\Delta \cdot p)^{-N-2}. \quad (35)$$

In the following we will insert the wave function renormalization [84] and perform a partial renormalization of the coupling constant [85] and the gauge parameter [84], cf. [82] for details. We will then denote the partly renormalized OMEs by $(\Delta) \tilde{A}_{ij}$.

The following representations hold for $\tilde{A}_{ij}$ and $(\Delta) \tilde{A}_{ij}$. The different partly renormalized OMEs are given by

$$\tilde{A}_{ij}^{\text{phys}} = \delta_{ij} + \sum_{k=1}^{\infty} S_\varepsilon^k \left(\frac{-p^2}{\mu^2} \right)^{k\varepsilon/2} a_s^k \tilde{A}_{ij}^{\text{phys},k} \quad (36)$$

$$\tilde{A}_{ij}^{\text{eom}} = \sum_{k=1}^{\infty} S_\varepsilon^k \left(\frac{-p^2}{\mu^2} \right)^{k\varepsilon/2} a_s^k \tilde{A}_{ij}^{\text{eom},k} \quad (37)$$

$$\tilde{A}_{ij}^{\text{ngi}} = \sum_{k=1}^{\infty} S_\varepsilon^k \left(\frac{-p^2}{\mu^2} \right)^{k\varepsilon/2} a_s^k \tilde{A}_{ij}^{\text{ngi},k}, \quad (38)$$

with μ the factorization scale and the spherical factor S_ε is given by

$$S_\varepsilon = \exp \left[\frac{\varepsilon}{2} (\gamma_E - \ln(4\pi)) \right], \quad (39)$$

where γ_E is the Euler-Mascheroni number. Analogous relations hold in the polarized case and the OMEs, cf. [82,83], and those of transversity, which are flavor non-singlet quantities. The structure of the partial amplitudes up to two-loop order is

$$\tilde{A}_{ij}^{\text{phys},1} = \frac{1}{\varepsilon} \gamma_{ij}^{(0)} + a_{ij}^{(1,0)} + \varepsilon a_{ij}^{(1,1)} + \varepsilon^2 a_{ij}^{(1,2)} + O(\varepsilon^3), \quad ij = qq \text{ NS}, qq, gq, gg, \quad (40)$$

$$\tilde{A}_{ij}^{\text{eom},1} = b_{ij}^{(1,0)} + \varepsilon b_{ij}^{(1,1)} + \varepsilon^2 b_{ij}^{(1,2)} + O(\varepsilon^3) \quad ij = qq \text{ NS}, qq, gq, gg, \quad (41)$$

$$\tilde{A}_{ij}^{\text{ngi},1} = \frac{1}{\varepsilon} \gamma_{gA}^{(0)} + c_{gA}^{(1,0)} + \varepsilon c_{gA}^{(1,1)} + \varepsilon^2 c_{gA}^{(1,2)} + O(\varepsilon^3), \quad ij = gg, \quad (42)$$

$$\tilde{A}_{ij}^{\text{phys},2} = \frac{1}{\varepsilon^2} a_{ij}^{(2,-2)} + \frac{1}{\varepsilon} a_{ij}^{(2,-1)} + a_{ij}^{(2,0)} + \varepsilon a_{ij}^{(2,1)} + O(\varepsilon^2), \quad ij = qq \text{ NS}, qq \text{ PS}, qq, gq, gg, \quad (43)$$

$$\tilde{A}_{ij}^{\text{eom},2} = \frac{1}{\varepsilon} b_{ij}^{(2,-1)} + b_{ij}^{(2,0)} + \varepsilon b_{ij}^{(2,1)} + O(\varepsilon^2), \quad ij = qq \text{ NS}, qq \text{ PS}, qq, gq, gg, \quad (44)$$

$$\tilde{A}_{ij}^{\text{ngi},2} = \frac{1}{\varepsilon^2} c_{ij}^{(2,-2)} + \frac{1}{\varepsilon} c_{ij}^{(2,-1)} + c_{ij}^{(2,0)} + \varepsilon c_{ij}^{(2,1)} + O(\varepsilon^2), \quad ij = qg, gg. \quad (45)$$

Here the contributions $e^{(k,-1(-2))}$ with $e = a, b, c$ contain the LO and NLO anomalous dimensions, cf. [19,20,81,82]. Structures which lead to new anomalous dimensions are dealt with in Section 3. In the polarized case there are no ngi contributions, but the eom terms for $ij = qq \text{ NS, PS}$ and gq to two-loop order. All results in the polarized case are presented in the Larin scheme [20,86].

There are also eom contributions in the transversity cases, which we will not deal with in the present paper, since the tensor composition in this case is even richer, cf. [83], but the anomalous dimensions come only from the physical part, cf. [82]. Note that our definitions differ in part from those in [19,20]. The corresponding mapping is obtained by performing the renormalization, which is carried out to 2-loop order in the present paper. The anomalous dimensions obey the following expansion in the strong coupling constant

$$\gamma_{ij}^a = \sum_{k=1}^{\infty} a_s^k \gamma_{ij}^{(k-1),a}. \quad (46)$$

Let us now turn to technical aspects of the calculation. The Feynman diagrams for the different operator insertions are generated by QGRAF [80,87]. The spinor and Lorentz-algebra is performed using FORM [88]. The different operator insertions are resummed using generating functions [89] either for even or odd integer moments, cf. [82], implied by the respective crossing relations [90,91]. In this way the local operators reappear in terms of propagators and one may derive the integration-by-parts relations [92] for the corresponding quantities, for which we use the package Crusher [93]. For part of the calculation we performed the reduction using Litered [94] and solved the differential equations by using the method of Refs. [95,96]. The general solution followed the route described in Refs. [81,82]. The relations between master integrals obtained by the reduction using Crusher allow to generate a sufficiently large number of Mellin moments by using the method of arbitrary high moments [97] for the different color and zeta factors, which formed the basis for the method of guessing [98,99], implemented in Sage [100,101], to determine the corresponding recurrences. Those were solved by applying difference-ring theory [102–111] as implemented in the package Sigma [112,113]. The generated recurrences in the present case factorize all at first order, unlike the case in a series of massive higher order calculations. First one obtains solutions in terms of also cyclotomic harmonic sums [114] because of separating even and odd moments. All the results can be written in terms of harmonic sums [115,116]

$$S_{b,\vec{a}}(N) = \sum_{k=1}^N \frac{(\text{sign}(b))^k}{k^{|b|}} S_{\vec{a}}(k), \quad S_{\emptyset} = 1, \quad a, b_i \in \mathbb{Z} \setminus \{0\}, \quad (47)$$

for which one maps first

$$S_{b,\vec{a}}(2N+1) = \frac{1}{2N+1} S_{\vec{a}}(2N+1) + S_{b,\vec{a}}(2N) \quad (48)$$

recursively and then applies the HarmonicSums [114–122] command Synchronize and finally the command TransformToBasis[expr, Online → True] is applied. All results are now obtained in terms of harmonic sums of argument N only.

In the following section we turn now to the calculation of the matrix elements of the so-called alien operators, which contribute via mixing to the (ultraviolet) operator renormalization in the unpolarized case and discuss in a subsequent section the mixing relations to two-loop order in explicit form.

3. The OMEs of the alien operators

These operator matrix elements contribute in the unpolarized case and have been discussed in detail in Refs. [15,19,79]. The OMEs containing gluonic operators mix with these OMEs. The operators are given by

$$\begin{aligned}
O_A^{\mu_1, \dots, \mu_N} = & i^{N-2} \mathbf{SSp} \left[F_\alpha^{a, \mu_1} D_\alpha \partial^{\mu_2} \dots \partial^{\mu_{N-1}} A_a^{\mu_N} \right. \\
& + i g f^{abc} F_\alpha^{a, \mu_1} \sum_{i=2}^{N-1} \kappa_i \partial^\alpha \left\{ (\partial^{\mu_2} \dots \partial^{\mu_{i-2}} A_b^{\mu_{i-1}}) (\partial^{\mu_2} \dots \partial^{\mu_{N-1}} A_c^{\mu_N}) \right\} \\
& \left. + O(g^3) \right] - \text{trace terms} , \tag{49}
\end{aligned}$$

$$\begin{aligned}
O_\omega^{\mu_1, \dots, \mu_N} = & i^{N-2} \mathbf{SSp} \left[\xi^a \partial^{\mu_1} \dots \partial^{\mu_{N-1}} \bar{\omega}^a \right. \\
& - i g f^{abc} \xi^a \sum_{i=2}^{N-1} \eta_i \partial^{\mu_1} \left\{ (\partial^{\mu_2} \dots \partial^{\mu_{i-2}} \bar{\omega}_b) (\partial^{\mu_2} \dots \partial^{\mu_{N-1}} A_c^{\mu_N}) \right\} \\
& \left. + O(g^3) \right] - \text{trace terms} , \tag{50}
\end{aligned}$$

$$O_B^{\mu_1, \dots, \mu_N} = i^{N-1} \mathbf{S} \left[g \bar{\psi}_k \gamma_{\mu_1} (T_a)^{kl} A^{a, \mu_2} \partial^{\mu_3} \dots \partial_{\mu_N} \psi_l + O(g^3) \right] - \text{trace terms} , \tag{51}$$

with

$$\kappa_i = \frac{(-1)^i}{8} + \frac{3}{8} \left[\frac{(n-2)!}{(i-1)!(n-i-1)!} - \frac{(n-2)!}{i!(N-i-2)!} \right] , \tag{52}$$

$$\eta_i = \frac{(-1)^i}{4} + \frac{1}{4} \left[3 \frac{(n-2)!}{(i-1)!(n-i-1)!} + \frac{(n-2)!}{i!(N-i-2)!} \right] , \tag{53}$$

and ξ , $\bar{\omega}$ denote the ghost and antighost respectively. The Feynman rules for these operator insertions are summarized in Appendix A.

To one loop order the OMEs are given by, after performing partial renormalization,

$$\tilde{A}_{\text{Aq}}^{\text{phys}} = a_s S_\varepsilon \left(\frac{-p^2}{\mu^2} \right)^{\varepsilon/2} \left[\frac{1}{\varepsilon} \gamma_{\text{Aq}}^{(0)} + a_{\text{Aq}}^{(1,0)} + \varepsilon a_{\text{Aq}}^{(1,1)} + \varepsilon^2 a_{\text{Aq}}^{(1,2)} \right] , \tag{54}$$

$$\tilde{A}_{\text{Aq}}^{\text{com}} = a_s S_\varepsilon \left(\frac{-p^2}{\mu^2} \right)^{\varepsilon/2} \left[b_{\text{Aq}}^{(1,0)} + \varepsilon b_{\text{Aq}}^{(1,1)} + \varepsilon^2 b_{\text{Aq}}^{(1,2)} \right] , \tag{55}$$

$$Q_{21} = 92N^{12} + 552N^{11} + 729N^{10} - 1226N^9 - 1623N^8 + 3246N^7 + 2599N^6 - 5526N^5 - 10329N^4 - 6766N^3 + 2772N^2 + 504N - 576, \quad (126)$$

$$Q_{22} = 320N^{12} + 3840N^{11} + 19840N^{10} + 57357N^9 + 99480N^8 + 114390N^7 + 103660N^6 + 40845N^5 - 103420N^4 - 176904N^3 - 103680N^2 - 34992N - 5184, \quad (127)$$

$$Q_{23} = -544N^{16} - 4352N^{15} - 10880N^{14} + 513N^{13} + 43712N^{12} + 41684N^{11} - 67480N^{10} - 119386N^9 - 6592N^8 + 133644N^7 + 221992N^6 + 105361N^5 - 75664N^4 - 1512N^3 + 21600N^2 + 1296N - 3456. \quad (128)$$

The eom part of A_{Bq} vanishes. In the above expressions the QCD color factor are $C_F = (N_c^2 - 1)/(2N_c)$, $C_A = N_c$, $T_F = 1/2$ for $SU(N_c)$ and $N_c = 3$ for QCD; (For interpretation of the colors, the reader is referred to the web version of this article.) N_F denotes the number of massless quark flavors. ζ_k , $k \in \mathbb{N}$, $k \geq 2$ are the values of Riemann's ζ function at integer arguments.

4. The operator mixing in the unpolarized singlet case

In the calculation of the off-shell OMEs in the unpolarized singlet case mixing between the physical and alien operators occurs, which we discuss in the following. In Mellin N -space the Z -factor for the (ultraviolet) renormalization of the local operators up to $O(a_s^2)$ reads

$$Z_{ij}^S = \delta_{ij} + a_s S_\epsilon \frac{\gamma_{ij}^{(0)}}{\epsilon} + a_s^2 S_\epsilon^2 \left[\frac{1}{\epsilon^2} \left(\frac{1}{2} \gamma_{il}^{(0)} \gamma_{lj}^{(0)} + \beta_0 \gamma_{ij}^{(0)} \right) + \frac{1}{2\epsilon} \gamma_{ij}^{(1)} \right] + O(a_s^3). \quad (129)$$

The renormalized physical OMEs are obtained by²

$$A_{ij}^{\text{phys}} = (Z_{ik}^S)^{-1} \tilde{A}_{kj}, \quad (130)$$

with³

² Note that we focus on the physical projection of the OMEs in this section, since the QCD anomalous dimensions are extracted from them. Similar relations can also be derived for the other projections.

³ The occurrence of the factor of $-1/2$ in (134) is due to a convention used in Ref. [19], which is, however, not correctly implemented in Ref. [19].

$$\tilde{A}_{qq}^{\text{PS}} = \tilde{A}_{qq}^{\text{PS,phys}}, \quad (131)$$

$$\tilde{A}_{qg} = \tilde{A}_{qg}^{\text{phys}}, \quad (132)$$

$$\tilde{A}_{gq} = \tilde{A}_{gq}^{\text{phys}} + \eta(\tilde{A}_{Aq} + \tilde{A}_{Bq}), \quad (133)$$

$$\tilde{A}_{gg} = \tilde{A}_{gg}^{\text{phys}} - \frac{\eta}{2}(\tilde{A}_{Ag} + \tilde{A}_{\omega g}), \quad (134)$$

and

$$\eta = -a_s S_\varepsilon \frac{\gamma_{gA}^{(0)}}{\varepsilon} + O(a_s^2). \quad (135)$$

The individual contributions $\tilde{A}_{ij}$ are given by

$$\begin{aligned} \tilde{A}_{qq}^{\text{PS}} = & a_s^2 S_\varepsilon^2 \left[\frac{1}{2\varepsilon^2} \gamma_{gq}^{(0)} \gamma_{qg}^{(0)} + \frac{1}{\varepsilon} \left(\gamma_{qg}^{(0)} a_{gq}^{(1,0)} + \frac{\gamma_{qq}^{\text{PS},(1)}}{2} \right) + a_{qq}^{\text{PS},(2,0)} + \varepsilon a_{qq}^{\text{PS},(2,1)} \right] \\ & + O(a_s^3), \end{aligned} \quad (136)$$

$$\begin{aligned} \tilde{A}_{qg} = & a_s S_\varepsilon \left[\frac{\gamma_{qg}^{(0)}}{\varepsilon} + a_{qg}^{(1,0)} + \varepsilon a_{qg}^{(1,1)} + \varepsilon^2 a_{qg}^{(1,2)} \right] + a_s^2 S_\varepsilon^2 \left[\frac{1}{2\varepsilon^2} \gamma_{qg}^{(0)} \left(\gamma_{gg}^{(0)} + \gamma_{qq}^{(0)} + 2\beta_0 \right) \right. \\ & \left. + \frac{1}{\varepsilon} \left(\gamma_{qg}^{(0)} a_{gg}^{(1,0)} + \gamma_{qq}^{(0)} a_{qg}^{(1,0)} + \frac{\gamma_{qg}^{(1)}}{2} \right) + a_{qg}^{(2,0)} + \varepsilon a_{qg}^{(2,1)} \right] + O(a_s^3), \end{aligned} \quad (137)$$

$$\begin{aligned} \tilde{A}_{gq} = & a_s S_\varepsilon \left[\frac{\gamma_{gq}^{(0)}}{\varepsilon} + a_{gq}^{(1,0)} + \varepsilon a_{gq}^{(1,1)} + \varepsilon^2 a_{gq}^{(1,2)} \right] + a_s^2 S_\varepsilon^2 \left[\frac{1}{2\varepsilon^2} \gamma_{gq}^{(0)} \left(\gamma_{gg}^{(0)} + \gamma_{qq}^{(0)} + 2\beta_0 \right) \right. \\ & \left. + \frac{1}{\varepsilon} \left(\gamma_{gg}^{(0)} a_{gq}^{(1,0)} + \gamma_{gq}^{(0)} a_{qq}^{(1,0)} + \frac{\gamma_{gq}^{(1)}}{2} \right) + \frac{\delta_{gq}^{(-1)}}{\varepsilon} + a_{gq}^{(2,0)} + \delta_{gq}^{(0)} + \varepsilon a_{gq}^{(2,1)} + \varepsilon \delta_{gq}^{(1)} \right] \\ & + O(a_s^3), \end{aligned} \quad (138)$$

$$\begin{aligned} \tilde{A}_{gg} = & 1 + a_s S_\varepsilon \left[\frac{\gamma_{gg}^{(0)}}{\varepsilon} + a_{gg}^{(1,0)} + \varepsilon a_{gg}^{(1,1)} + \varepsilon^2 a_{gg}^{(1,2)} \right] + a_s^2 S_\varepsilon^2 \left[\frac{1}{2\varepsilon^2} \gamma_{gg}^{(0)} \left(\gamma_{gg}^{(0)} + 2\beta_0 \right) \right. \\ & \left. + \gamma_{gq}^{(0)} \gamma_{qg}^{(0)} \right] + \frac{1}{\varepsilon} \left(\gamma_{gg}^{(0)} a_{gg}^{(1,0)} + \gamma_{gq}^{(0)} a_{qg}^{(1,0)} + \frac{\gamma_{gg}^{(1)}}{2} \right) + \frac{\delta_{gg}^{(-1)}}{\varepsilon} + a_{gg}^{(2,0)} + \delta_{gg}^{(0)} \\ & \left. + \varepsilon a_{gg}^{(2,1)} + \varepsilon \delta_{gg}^{(1)} \right] + O(a_s^3). \end{aligned} \quad (139)$$

In the flavor non-singlet cases, including transversity [82], and in the polarized singlet case [81] no mixing with the alien operators occurs. To two-loop order, these terms contribute in the renormalization of $\tilde{A}_{gq}$ and $\tilde{A}_{gg}$, since one has to consider the combinations (133), (134) in this case. Because of this the additional contributions

$$\delta_{gq}^{(i-1)} = -\gamma_{gA}^{(0)} \left(a_{Aq}^{(1,i)} + a_{Bq}^{(1,i)} \right), \quad i \geq 0, \quad (140)$$

$$\delta_{gg}^{(i-1)} = \frac{\gamma_{gA}^{(0)}}{2} \left(a_{Ag}^{(1,i)} + a_{\omega g}^{(1,i)} \right), \quad i \geq 0 \quad (141)$$

are present. The anomalous dimensions are obtained from the pole terms of (136)–(139).

5. The unpolarized OMEs

We now turn to the calculation of contributions to the unpolarized off-shell OMEs for non-negative order in the dimensional parameter ε . They are gauge dependent in general and are given by⁴

$$a_{qq}^{(1,0),\text{NS}} = C_F \left[-\frac{P_{39}}{N^2(1+N)^2} + \frac{2S_1}{N(1+N)} - 2S_1^2 - 6S_2 + \xi \left(-\frac{1}{N} + S_1 \right) \right], \quad (142)$$

$$\begin{aligned} a_{qq}^{(1,1),\text{NS}} = C_F & \left[\xi \left(\frac{1-N+2N^2}{2N^2} + \frac{(1-N)S_1}{2N} - \frac{1}{4}S_1^2 - \frac{3}{4}S_2 \right) + \frac{P_{299}}{N^3(1+N)^3} \right. \\ & + \left(-\frac{(N-1)(-1-N+N^2)}{N^2(1+N)^2} + 3S_2 \right) S_1 - \frac{S_1^2}{2N(1+N)} \\ & + \frac{1}{3}S_1^3 - \frac{3S_2}{2N(1+N)} \\ & \left. + \frac{14}{3}S_3 + \left(\frac{2+3N+3N^2}{4N(1+N)} - S_1 \right) \xi_2 \right], \quad (143) \end{aligned}$$

$$\begin{aligned} a_{qq}^{(1,2),\text{NS}} = C_F & \left[\xi \left(\frac{-1+N-4N^3}{4N^3} + \left(\frac{N-1}{4N^2} + \frac{3S_2}{8} \right) S_1 + \frac{(N-1)S_1^2}{8N} + \frac{1}{24}S_1^3 \right. \right. \\ & + \frac{3(N-1)S_2}{8N} + \frac{7}{12}S_3 + \left(\frac{1}{8N} - \frac{S_1}{8} \right) \xi_2 \left. \right) + \frac{P_{469}}{2N^4(1+N)^4} \\ & + \left(-\frac{(N-1)(1+2N-2N^3+N^4)}{2N^3(1+N)^3} + \frac{3S_2}{4N(1+N)} - \frac{7}{3}S_3 \right) S_1 \\ & - \left(\frac{(N-1)(1+N-N^2)}{4N^2(1+N)^2} + \frac{3}{4}S_2 \right) S_1^2 + \frac{S_1^3}{12N(1+N)} - \frac{1}{24}S_1^4 \\ & + \frac{3(N-1)(-1-N+N^2)S_2}{4N^2(1+N)^2} - \frac{9}{8}S_2^2 + \frac{7S_3}{6N(1+N)} \\ & - \frac{15}{4}S_4 + \left(\frac{P_{39}}{8N^2(1+N)^2} - \frac{S_1}{4N(1+N)} + \frac{1}{4}S_1^2 + \frac{3}{4}S_2 \right) \xi_2 \\ & \left. + \left(\frac{7}{3}S_1 - \frac{7(2+3N+3N^2)}{12N(1+N)} \right) \xi_3 \right], \quad (144) \end{aligned}$$

$$a_{qq}^{(2,0),\text{NS}} = \xi^2 \left[C_A C_F \left(\frac{1+2N}{4N} + \frac{(2-3N)S_1}{4N} - \frac{1}{4}S_1^2 - \frac{1}{4}S_2 \right) \right]$$

⁴ The polynomials are listed in Appendix B.

$$\begin{aligned}

6. The polarized OMEs

The expansion coefficients in the polarized flavor singlet case are calculated using the Larin scheme [20,86], as the complete calculation of the massless off-shell OMEs in the polarized case. By this one obtains the anomalous dimensions in the Larin scheme, which are finally transformed into the $\overline{\text{M}}$ scheme [20,25]. In the non-singlet case one could use a known Ward identity and obtain the anomalous dimension directly in the $\overline{\text{MS}}$ scheme. However, the consistent renormalization of the singlet case requires to calculate the non-singlet also in the Larin scheme.

7. The transversity OMEs

In the case of transversity various OMEs contribute [82,83]. Here we only consider the expansion coefficients contributing to the physical projection $A_{qq}^{\text{tr},\pm}$. The coefficients corresponding to the non-negative powers in ε are given by

$$a_{qq}^{(1,0),\text{tr},+} = C_F \xi S_1 + C_F (7 - 2S_1^2 - 6S_2), \quad (227)$$

$$\begin{aligned} a_{qq}^{(1,1),\text{tr},+} = & C_F \xi \left[\frac{-1+2N}{2N} - \frac{1}{2}S_1 - \frac{1}{4}S_1^2 - \frac{3}{4}S_2 \right] \\ & + C_F \left(\frac{-1-6N-7N^2}{N(1+N)} + \frac{1}{3}S_1^3 + 3S_1S_2 \right. \\ & \left. + \frac{14}{3}S_3 + \left(\frac{3}{4} - S_1 \right) \zeta_2 \right), \end{aligned} \quad (228)$$

$$\begin{aligned} a_{qq}^{(1,2),\text{tr},+} = & C_F \xi \left[-\frac{(-1+2N)(1+2N)}{4N^2} + \left(\frac{1}{4N} + \frac{3S_2}{8} \right) S_1 \right. \\ & \left. + \frac{1}{8}S_1^2 + \frac{1}{24}S_1^3 + \frac{3}{8}S_2 + \frac{7}{12}S_3 - \frac{1}{8}S_1\zeta_2 \right] \\ & + C_F \left(\frac{P_{121}}{2N^2(1+N)^2} + \left(\frac{1-N}{2N(1+N)} - \frac{7S_3}{3} \right) S_1 - \frac{1}{24}S_1^4 - \frac{3}{4}S_1^2S_2 \right. \\ & \left. - \frac{9}{8}S_2^2 - \frac{15}{4}S_4 + \left(-\frac{7}{8} + \frac{S_1^2}{4} + \frac{3S_2}{4} \right) \zeta_2 + \left(-\frac{7}{4} + \frac{7S_1}{3} \right) \zeta_3 \right), \end{aligned} \quad (229)$$

& - 40S_{2,-3} + \frac{2(-10+3N)S_{3,1}}{2+N} \\
& + 24S_{-2,3} + 56S_{-4,1} + \frac{4(4+N)S_{2,1,1}}{2+N} \\
& + 16S_{2,1,-2} + 16S_{-2,2,1} + 48S_{-3,1,1} \\
& + 32S_{-2,1,1,1} + \left(\frac{16+87N+87N^2}{8N(1+N)} \right. \\
& \left. + \left(-14+16S_2 \right) S_1 + 8S_{-2}S_1 - 3S_1^2 + 4S_1^3 \right. \\
& \left. - 12S_2 + 4S_3 + 4S_{-3} - 8S_{-2,1} \right) \zeta_2 + \frac{72\zeta_2^2}{5(2+N)} \\
& + \left(\frac{92}{3}S_1^2 - 12S_2 - 24S_{-2} - \frac{3P_{85}}{(N-1)(1+N)(2+N)^2} \right. \\
& \left. - \frac{8(7+5N)S_1}{2+N} \right) \zeta_3. \tag{236}
\end{aligned}$$

In summary, the expressions shown in Sections 3–6 depend on the following 28 harmonic sums after algebraic reduction [118],

$$\begin{aligned}
& \{S_{-5}, S_{-4}, S_{-3}, S_{-2}, S_1, S_2, S_3, S_4, S_5, S_{-4,1}, S_{-3,1}, S_{-2,1}, S_{-2,2}, S_{-2,3}, S_{2,-3}, \\
& S_{2,1}, S_{2,3}, S_{3,1}, S_{4,1}, S_{-3,1,1}, S_{-2,1,1}, S_{-2,2,1}, \\
& S_{2,1,-2}, S_{2,1,1}, S_{2,2,1}, S_{3,1,1}, S_{-2,1,1,1}, S_{2,1,1,1}\}. \tag{237}
\end{aligned}$$

After applying also the structural relations [121] the following 13 sum contribute,

$$\begin{aligned}
& \{S_1, S_{-2,1}, S_{2,1}, S_{-3,1}, S_{4,1}, S_{-4,1}, S_{-2,1,1}, \\
& S_{2,1,1}, S_{-3,1,1}, S_{-2,2,1}, S_{2,2,1}, S_{-2,1,1,1}, S_{2,1,1,1}\}. \tag{238}
\end{aligned}$$

8. Comparison to the literature

In Refs. [19,20], extending earlier results in Refs. [15,79], unpolarized and polarized OMEs have been calculated to $O(a_s^2\epsilon^0)$, i.e. one order in ϵ less than in the present calculation and the OMEs of transversity were not considered. The calculation has been carried out in z -space. This

has been slightly before harmonic sums [115,116] and harmonic polylogarithms [122] became the standard entities to represent different calculation steps and the final results in single scale calculations. Therefore classical polylogarithms and Nielsen integrals [123–128], partly with involved argument, were used. In [19,20] the expansion coefficients of the completely unrenormalized OMEs are discussed, while we perform the renormalization of the strong coupling and the gauge parameter first. Furthermore, the gauge parameter there is $\tilde{\xi} = 1 - \xi$, compared to the present case. In the following we summarize a series of differences to the present results which we have observed, both due to typographical and combinatoric errors. Comparing to [19,20] one first observes that the concrete results for the non-singlet OMEs differ by a global minus sign. For all the other OMEs we find a relative minus sign at $O(\alpha_s)$, but agree at $O(\alpha_s^2)$. The formal representations in terms of anomalous dimensions, i.e. Eqs. (2.8, 2.16, 2.31, 2.34) of Ref. [19] and Eqs. (2.18, 2.24, 2.26, 2.29) of Ref. [20], are, however, correct. Furthermore, the expressions for $\hat{\Delta}_{iq}^{\text{phys}}$ there are obtained as the sum $\hat{\Delta}_{iq}^{\text{phys}} + \hat{\Delta}_{iq}^{\text{eom}}$ of the present results in the Larin scheme.

After adjusting the signs we find also some specific differences. Let us define

$$\delta A_{ij}^{(k)}(x) = A_{ij}^{(k),\text{this calc.}}(x) - A_{ij}^{(k),[19]}(x). \quad (239)$$

$$\delta \Delta A_{ij}^{(k)}(x) = \Delta A_{ij}^{(k),\text{this calc.}}(x) - \Delta A_{ij}^{(k),[20]}(x). \quad (240)$$

We will express the differences in Mellin N space, after adjusting the signs as mentioned above. In the unpolarized case we find the following difference in the non-singlet physical case

$$\delta A_{qq}^{\text{NS,phys}}(N) = a_s^2 \frac{C_F}{\varepsilon} \left(10S_1^2 + 10S_2 - \frac{20S_1}{N} \right), \quad (241)$$

however, the constant part of the OME agree. For the gluonic OME we find the difference

$$\begin{aligned} \delta A_{gg}^{\text{phys}}(N) = a_s C_A \left[\frac{20}{N^2} + \frac{20S_1}{N} - 10S_1^2 - 30S_2 + 20\zeta_2 - \varepsilon C_A \left(\frac{\xi\zeta_2}{4} + \frac{2\zeta_3}{3} \right) \right] \\ + a_s^2 C_A \zeta_3 \left[\frac{20}{9} C_A - \frac{16}{9} N_F T_F \right]. \end{aligned} \quad (242)$$

Since these differences at $O(a_s \varepsilon)$ and $O(a_s^2)$ are independent of N they are probably due to wrong reducible contributions. In the pure-singlet and qg case we find bigger differences of

$$\begin{aligned} \delta A_{qq}^{\text{PS,phys}}(N) \\ = a_s^2 C_F N_F T_F \left(- \frac{8(32 - 8N + 80N^2 + 314N^3 + 311N^4 + 120N^5 + 15N^6)}{3(-1+N)N(1+N)^3(2+N)^3} \right. \\ \left. - \frac{8(44 + 36N + 19N^2 + 30N^3 + 15N^4)S_1}{3(-1+N)N(1+N)^2(2+N)^2} \right. \\ \left. + \frac{8(-2 + 5N + 5N^2)(S_2 + S_1^2)}{(-1+N)N(1+N)(2+N)} \right) \end{aligned} \quad (243)$$

$$\begin{aligned} \delta A_{qg}^{\text{phys}}(N) = a_s^2 N_F^2 T_F^2 \left(\frac{64(-8 - 5N + 3N^2 + 2N^3)}{3(1+N)^3(2+N)^3} + \frac{32(-4 - N + N^2)S_1}{3(1+N)^2(2+N)^2} \right. \\ \left. - \frac{16S_1^2}{3(1+N)(2+N)} - \frac{16S_2}{(1+N)(2+N)} + \frac{32\zeta_2}{3(1+N)(2+N)} \right) \end{aligned} \quad (244)$$

Note that the $O(\varepsilon^0)$ contribution in (242) is not in agreement with the earlier calculation [15,79], where the corresponding expansion has been given to $O(\varepsilon^0)$.

In the polarized case we find large differences in the constant parts of the non-singlet OMEs, which we do not give explicitly here. Further smaller differences are found in the OME qg

$$\delta\Delta A_{qg}^{\text{phys}}(N) = a_s^2 N_F^2 T_F^2 \left(\frac{64(2+4N-3N^2)}{9N^2(1+N)^2} + \frac{32(4-N)S_1}{9N(1+N)} \right) \quad (245)$$

and the gluonic OME

$$\delta\Delta A_{gg}^{\text{phys}}(N) = -a_s \varepsilon C_A \left(\frac{\xi\zeta_2}{4} + \frac{2\zeta_3}{3} \right) + a_s^2 C_A \zeta_3 \left[\frac{20}{9} C_A - \frac{16}{9} N_F T_F \right] \quad (246)$$

The differences in the constant parts of the OMEs do not affect the extraction of the NLO splitting functions, but they are needed for the correct renormalization of the OMEs at $O(a_s^3)$ and therefore for the extraction of the splitting functions at the next loop order. Because of these aspect it is therefore rather difficult to use these older results in current calculations.

9. Conclusions

We have calculated the unpolarized and polarized massless off-shell twist-2 operator matrix elements in QCD to two-loop orders in an automated way. These quantities are of interest because they allow the direct calculation of the QCD anomalous dimensions. Contrary to this, on shell massive operator matrix elements only allow to compute the anomalous dimensions of contributions $\propto T_F$ in the same order in perturbation theory and require the corrections of one more order in the coupling constant to obtain the complete anomalous dimensions. The off-shellness implies gauge variant expressions in general. In particular, the equation of motion is not valid anymore for these terms and non-gauge invariant contributions are present, which may mix with the gauge invariant contributions. Despite of these technical complications, the method allows for a direct calculations of the anomalous dimensions. The on-shell calculation of the forward Compton amplitude also allows to compute the anomalous dimensions contributing to the deep-inelastic structure functions. However, special arrangements are necessary for the gluonic contributions, which require auxiliary Higgs- and graviton fields, also complicating this method.

We compared our results to those in Refs. [19,20] for the contributions to $O(a_s^2\varepsilon^0)$ and calculated newly the contributions of $O(a_s\varepsilon^2)$ and $O(a_s^2\varepsilon)$, which contribute to the calculation of the four-loop anomalous dimensions. In the comparison we have found a series of errors in the previous calculations [19,20]. If results of these papers, beyond the anomalous dimensions have been used in the literature, these results have to be corrected. In particular, as a by-product of the present calculation all unpolarized and the polarized anomalous dimensions and those for transversity are correctly obtained to two-loop order [8–18,32,34–36,38,81,82]. Our calculation has been performed in an algorithmic manner using well established methods having been applied in various massless and massive three-loop calculations before, as e.g. [36,38,129]. The present formalism allows extensions to higher loop calculations. Here, however, also new structures are expected to emerge and the complexity of the calculation will naturally be larger. The quantities to be computed are expressible in terms of the usual harmonic sums [115,116] and no other function spaces as e.g. [114,119,120,130] are required to derive and express the results such as the different expansion coefficients of the different massless OMEs and the anomalous dimensions.

CRediT authorship contribution statement

The authors have equally contributed in different fields to the results presented in the present paper.

This project has received funding from the European Union's Horizon 2020 research and innovation programme under the Marie Skłodowska-Curie grant agreement No. 764850, SAGEX, and from the Austrian Science Fund (FWF) grant SFB F50 (F5009-N15) and P33530.

Appendix A. Feynman rules

The alien operators introduce new Feynman rules for operator insertions. They have been given in Refs. [15,19,79]. We give them here for completeness and correct typographical errors; particularly all sums have to start with the lower index 0.

$$O_{A,\mu\nu}^{ab}(p, -p) = \delta^{ab} \frac{1 + (-1)^N}{2} \left[2\Delta_\mu \Delta_\nu p^2 - (p_\mu \Delta_\nu + p_\nu \Delta_\mu) \Delta \cdot p \right] (\Delta \cdot p)^{N-2}, \quad (247)$$

$$O_{A,\mu\nu\lambda}^{abc}(p, q, k) = -ig \frac{1 + (-1)^N}{2} f^{abc} V_{\mu\nu\lambda}^{(3)}(p, q, k), \quad (248)$$

$$O_\omega^{ab}(p, -p) = -\delta^{ab} (\Delta \cdot p)^N, \quad (249)$$

$$O_{\omega,\mu}^{abc}(p, q, k) = ig f^{abc} \tilde{V}_\mu^{(3)}(p, q, k), \quad (250)$$

$$\begin{aligned} & V_{\mu\nu\lambda}^{(3)}(p, q, k) \\ &= \left[\Delta_\mu \Delta_\nu (q_\lambda - p_\lambda) + \Delta_\mu \Delta_\lambda (p_\nu - k_\nu) + g_{\nu\lambda} \Delta_\mu (\Delta \cdot k - \Delta \cdot q) \right] (\Delta \cdot p)^{N-2} \\ & - \frac{1}{4} \Delta_\nu \Delta_\lambda (\Delta_\mu p^2 - p_\mu \Delta \cdot p) \sum_{i=0}^{N-3} \left[(-\Delta \cdot q)^i (\Delta \cdot k)^{N-3-i} - 3(-\Delta \cdot k)^i (\Delta \cdot p)^{N-3-i} \right. \\ & \left. - 3(-\Delta \cdot p)^i (\Delta \cdot q)^{N-3-i} \right] + \left\{ \begin{matrix} p \rightarrow q \rightarrow k \rightarrow p \\ \mu \rightarrow \nu \rightarrow \lambda \rightarrow \mu \end{matrix} \right\} + \left\{ \begin{matrix} p \rightarrow k \rightarrow q \rightarrow p \\ \mu \rightarrow \lambda \rightarrow \nu \rightarrow \mu \end{matrix} \right\} \end{aligned} \quad (251)$$

$$\begin{aligned} \tilde{V}_\mu^{(3)}(p, q, k) &= \Delta_\mu \left[\frac{1}{2} (\Delta \cdot k)^{N-1} + \frac{1}{4} (\Delta \cdot q - 3\Delta \cdot k) (\Delta \cdot q)^{N-2} \right. \\ & \left. + \frac{1}{4} (\Delta \cdot k - \Delta \cdot q) (\Delta \cdot p)^{N-2} - \frac{3}{4} (\Delta \cdot k)^2 \sum_{i=0}^{N-3} (\Delta \cdot k)^i (-\Delta \cdot q)^{N-3-i} \right]. \end{aligned} \quad (252)$$

Appendix B. The polynomials

In the following we list the polynomials occurring in Eqs. (142)–(192), (193)–(226) and (227)–(236).

$$P_1 = -102241N^4 - 197090N^3 - 96529N^2 - 1680N + 1584 \quad (253)$$

$$P_2 = -2895N^4 - 5822N^3 - 2863N^2 - 512N - 192 \quad (254)$$

$$P_3 = -521N^4 - 1258N^3 + 439N^2 - 2280N - 144 \quad (255)$$

$$P_4 = -367N^4 - 602N^3 + 895N^2 + 866N - 648 \quad (256)$$

$$P_5 = -263N^4 - 574N^3 + 97N^2 - 360N + 96 \quad (257)$$

$$P_6 = -155N^4 - 265N^3 - 161N^2 + 75N + 18 \quad (258)$$

$$P_7 = -155N^4 - 175N^3 - 89N^2 + 57N + 18 \quad (259)$$

$$P_8 = -137N^4 - 289N^3 - 227N^2 - 291N - 60 \quad (260)$$

$$P_9 = -127N^4 - 140N^3 + 331N^2 + 260N - 180 \quad (261)$$

$$P_{10} = -101N^4 - 96N^3 + 260N^2 + 33N + 18 \quad (262)$$

$$P_{11} = -97N^4 - 78N^3 + 333N^2 + 218N - 160 \quad (263)$$

$$P_{12} = -82N^4 - 155N^3 - 126N^2 - 107N - 34 \quad (264)$$

$$P_{13} = -82N^4 - 137N^3 - 22N^2 - 5N - 18 \quad (265)$$

$$P_{14} = -73N^4 - 119N^3 - 103N^2 + 33N + 18 \quad (266)$$

$$P_{15} = -73N^4 - 65N^3 - 31N^2 + 51N + 18 \quad (267)$$

$$P_{16} = -67N^4 - 152N^3 - 31N^2 - 162N - 72 \quad (268)$$

$$P_{17} = -63N^4 - 171N^3 - 52N^2 + 4N + 48 \quad (269)$$

$$P_{18} = -63N^4 - 29N^3 + 260N^2 + 12N + 144 \quad (270)$$

$$P_{19} = -55N^4 - 273N^3 - 366N^2 - 28N + 152 \quad (271)$$

$$P_{20} = -49N^4 - 6N^3 + 67N^2 + 38N - 2 \quad (272)$$

$$P_{21} = -33N^4 - 195N^3 - 348N^2 - 182N - 30 \quad (273)$$

$$P_{22} = -33N^4 - 66N^3 - 31N^2 + 2N - 64 \quad (274)$$

$$P_{23} = -30N^4 - 39N^3 + 6N^2 - 19N - 22 \quad (275)$$

$$P_{24} = -29N^4 + 6N^3 + 47N^2 + 14N - 6 \quad (276)$$

$$P_{25} = -28N^4 - 56N^3 + 137N^2 + 171N - 12 \quad (277)$$

$$P_{26} = -17N^4 - 34N^3 + 49N^2 + 66N + 32 \quad (278)$$

$$P_{27} = -14N^4 - 64N^3 - 59N^2 - 57N - 14 \quad (279)$$

$$P_{28} = -14N^4 - 40N^3 - 27N^2 - 17N - 4 \quad (280)$$

$$P_{29} = -14N^4 - 40N^3 + 13N^2 - 9N - 14 \quad (281)$$

$$P_{30} = -14N^4 - 32N^3 - 3N^2 - N - 4 \quad (282)$$

$$P_{31} = -13N^4 - 37N^3 - 18N^2 - 28N + 24 \quad (283)$$

$$P_{32} = -13N^4 - 19N^3 - 50N^2 - 30N - 8 \quad (284)$$

$$P_{33} = -11N^4 - 22N^3 - 37N^2 - 26N - 48 \quad (285)$$

$$P_{34} = -11N^4 - 22N^3 - 5N^2 + 6N - 16 \quad (286)$$

$$P_{35} = -9N^4 - 38N^3 - 104N^2 - 64N - 32 \quad (287)$$

$$P_{36} = -9N^4 + 62N^3 + 125N^2 + 54N - 40 \quad (288)$$

$$P_{37} = -8N^4 - 21N^3 - 10N^2 + 3N + 4 \quad (289)$$

$$P_{38} = -7N^4 - 20N^3 - 15N^2 - 8N - 2 \quad (290)$$

$$P_{39} = -7N^4 - 16N^3 - 3N^2 - 2 \quad (291)$$

$$P_{40} = -5N^4 - 20N^3 - 33N^2 - 18N + 4 \quad (292)$$

$$P_{41} = -3N^4 - 157N^3 - 558N^2 - 324N - 104 \quad (293)$$

$$P_{42} = -3N^4 - 16N^3 - 35N^2 - 22N + 4 \quad (294)$$

$$P_{43} = -3N^4 - 6N^3 + 27N^2 + 46N - 120 \quad (295)$$

$$P_{44} = -2N^4 - 9N^3 - 7N^2 + 4N - 30 \quad (296)$$

$$P_{45} = -2N^4 - 6N^3 + 3N^2 + 20N + 17 \quad (297)$$

$$P_{46} = -2N^4 - 4N^3 + N^2 + 21N - 36 \quad (298)$$

$$P_{47} = -2N^4 - 3N^3 - 9N^2 - 8N + 4 \quad (299)$$

$$P_{48} = -N^4 - 3N^3 + 4N^2 + 10N - 30 \quad (300)$$

$$P_{49} = -N^4 - 2N^3 + 15N^2 - 22N + 12 \quad (301)$$

$$P_{50} = -N^4 + 2N^3 + 3N^2 - 2N - 4 \quad (302)$$

$$P_{51} = -N^4 + 4N^3 - 6N^2 - 4N - 1 \quad (303)$$

$$P_{52} = -N^4 + 6N^3 - 10N^2 + 5N - 1 \quad (304)$$

$$P_{53} = -N^4 + 7N^3 + 3N^2 - 3N - 2 \quad (305)$$

$$P_{54} = N^4 - 15N^3 - 94N^2 - 106N + 210 \quad (306)$$

$$P_{55} = N^4 - 12N^3 - 22N^2 + 21N + 6 \quad (307)$$

$$P_{56} = N^4 - 9N^3 + 15N^2 + 13N + 4 \quad (308)$$

$$P_{57} = N^4 - 6N^3 - 29N^2 - 20N + 6 \quad (309)$$

$$P_{58} = N^4 - 6N^3 + 7N^2 - 2N - 4 \quad (310)$$

$$P_{59} = N^4 - 5N^3 - 10N^2 - 28N + 24 \quad (311)$$

$$P_{60} = N^4 - 4N^3 + 7N^2 - 4N + 8 \quad (312)$$

$$P_{61} = N^4 - 2N^3 - 6N^2 + 4N + 1 \quad (313)$$

$$P_{62} = N^4 - 2N^3 + 11N^2 - 24N - 14 \quad (314)$$

$$P_{63} = N^4 - N^3 + 8N^2 + 25N - 14 \quad (315)$$

$$P_{64} = N^4 + 3N^3 + 16N^2 + 4N - 16 \quad (316)$$

$$P_{65} = N^4 + 4N^3 + 7N^2 - 4N - 12 \quad (317)$$

$$P_{66} = N^4 + 4N^3 + 9N^2 + 6N - 2 \quad (318)$$

$$P_{67} = N^4 + 5N^3 + 5N^2 + 3N + 4 \quad (319)$$

$$P_{68} = N^4 + 8N^3 + 14N^2 + 5N + 6 \quad (320)$$

$$P_{69} = N^4 + 8N^3 + 19N^2 + 4N - 12 \quad (321)$$

$$P_{70} = N^4 + 10N^3 + 29N^2 + 20N - 4 \quad (322)$$

$$P_{71} = N^4 + 20N^3 + 59N^2 + 70N + 36 \quad (323)$$

$$P_{72} = 2N^4 + N^3 + 4N^2 - N - 1 \quad (324)$$

$$P_{73} = 2N^4 + 2N^3 + N^2 - 7N - 2 \quad (325)$$

$$P_{74} = 2N^4 + 5N^3 - 9N^2 + 30N + 8 \quad (326)$$

$$P_{75} = 2N^4 + 5N^3 + 4N^2 - 4N - 2 \quad (327)$$

$$P_{76} = 2N^4 + 7N^3 - 2N^2 - 9N + 6 \quad (328)$$

$$P_{77} = 2N^4 + 7N^3 + 4N^2 + N + 4 \quad (329)$$

$$P_{78} = 2N^4 + 14N^3 + 29N^2 + 31N + 24 \quad (330)$$

$$P_{79} = 3N^4 - 237N^3 - 100N^2 + 20N - 64 \quad (331)$$

$$P_{80} = 3N^4 - 45N^3 - 82N^2 + 22N + 12 \quad (332)$$

$$P_{81} = 3N^4 - 9N^3 - 22N^2 + 10N + 4 \quad (333)$$

$$P_{82} = 3N^4 - N^3 - 12N^2 + 6N + 2 \quad (334)$$

$$P_{83} = 3N^4 + 2N^3 + 11N^2 - 4N - 4 \quad (335)$$

$$P_{84} = 3N^4 + 3N^3 + 12N^2 + 32N + 8 \quad (336)$$

$$P_{85} = 3N^4 + 4N^3 - 23N^2 + 4N + 36 \quad (337)$$

$$P_{86} = 3N^4 + 7N^3 - 32N^2 - 76N - 48 \quad (338)$$

$$P_{87} = 3N^4 + 8N^3 - 8N^2 + 3N + 6 \quad (339)$$
