Observation of an excess of di-charmonium events in the four-muon final state with the ATLAS detector

The ATLAS Collaboration

A search is made for potential $c\bar{c}\bar{c}\bar{c}$ tetraquarks decaying into a pair of charmonium states in the four muon final state using proton–proton collision data at $\sqrt{s} = 13$ TeV, corresponding to an integrated luminosity of 140 fb^{-1} recorded by the ATLAS experiment at LHC. Two decay channels, $J/\psi + J/\psi \rightarrow 4\mu$ and $J/\psi + \psi(2S) \rightarrow 4\mu$, are studied. Backgrounds are estimated based on a hybrid approach involving Monte Carlo simulations and data-driven methods. Statistically significant excesses are seen in the di- J/ψ channel consistent with a narrow resonance at 6.9 GeV and a broader structure at lower mass. A statistically significant excess is also seen in the $J/\psi + \psi(2S)$ channel. The fitted masses and decay widths of the structures are reported.

Beyond the conventional mesons ($q\bar{q}$) and baryons (qqq or $\bar{q}\bar{q}\bar{q}$), exotic hadrons composed of four ($qq\bar{q}\bar{q}$) or five quarks ($qqqq\bar{q}$) are also allowed under color confinement. The $X(3872)$ particle discovered by Belle in 2003 was the first tetraquark (TQ) candidate [1], and was followed by a series of further candidates designated as X, Y, and Z states [2]. In 2020, LHCb observed a narrow $X(6900)$ structure in the di- J/ψ channel [3]. The structure could be interpreted as a tetraquark with four charm quarks, $T_{cc\bar{c}\bar{c}}$. An additional enhancement closer to the di- J/ψ mass threshold was also observed in the LHCb data. Since the 6.9 GeV LHCb resonance is above the $J/\psi+\psi(2S)$ mass threshold, a structure in the $J/\psi+\psi(2S)$ channel is also possible. Both channels are investigated by ATLAS in a quite different phase space region from LHCb, and the new channel of $J/\psi+\psi(2S)$ provides more information for di-charmonium excesses. For example in some predictions, the two channels are coupled via Pomeron exchange between the two charmonia, and $X(6900)$ is dynamically produced [4].

A search in the 4μ final state produced through the di- J/ψ and $J/\psi+\psi(2S)$ channels is carried out, using 140 fb^{-1} of LHC proton–proton (pp) data collected by the ATLAS experiment at a center-of-mass energy of $\sqrt{s} = 13 \text{ TeV}$ between the years 2015 and 2018. Only the data where all detector systems are functional and recording high-quality data are used. The ATLAS detector [5] covers nearly the entire solid angle around the collision point¹ with layered tracking detectors, calorimeters and muon chambers. The muon and tracking systems are of particular importance in the reconstruction of charmonia. The inner tracking detector (ID) consists of a silicon pixel detector, a silicon microstrip detector and a transition radiation tracker. The muon spectrometer (MS) surrounds the calorimeters and consists of three large superconducting air-core toroids with eight coils each, a system of tracking chambers, and detectors for triggering. Muons are reconstructed using information from the ID and MS systems.

Signal and background processes are estimated partly by Monte Carlo (MC) simulations and partly from data. The main backgrounds are di-charmonium production via single parton scattering (SPS) [6–10], and double parton scattering (DPS) [11–17], non-prompt J/ψ production from b -hadron decays, prompt single J/ψ production and non-resonant di-muon production. PYTHIA 8.244 [18] is used to generate SPS, DPS and non-prompt di-charmonium events. Both the color-singlet and color-octet intermediate states are included for J/ψ and $\psi(2S)$. The A14 [19] set of parameter values and the NNPDF23LO [20] parton distribution functions (PDF) [21] are used. PHOTOS 3.61 [22] is applied to simulate final state radiation in particle decays. Signal events are simulated with the event generator JHU [23] and CTEQ6L1 PDF [24], or with PYTHIA and the NNPDF23LO PDF. Feed-down backgrounds from the $J/\psi+\psi(2S)$ channel to di- J/ψ are included. A natural width of 100 MeV is assumed for all the resonances with no interference between them. An extensive software suite [25] is used in data simulation [26], in the reconstruction and analysis of real and simulated data, in detector operations, and in the trigger and data acquisition systems of the experiment. The MC simulated events are weighted to reproduce the same number of pp interactions per bunch crossing (pileup) and trigger conditions as occur in data. The remaining backgrounds which contain a single or no charmonium are modeled using the data.

The data sample was collected with triggers requiring either two muons with invariant mass compatible with J/ψ or $\psi(2S)$ mesons (mass in the range of [2.5, 4.3] GeV), or three muons containing at least one such di-muon pair [27, 28]. Combinations of triggers with different prescales [29] depending on the run period are used to give the largest acceptance. The trigger efficiency for the $X(6900)$ relative to the offline selection is about 72%. Dedicated ATLAS offline software is used to reconstruct the charmonium and 4μ candidates in each event recorded by the triggers. In each event containing at least four muons with two opposite-charge pairs, the ID tracks are fit to a common vertex. Afterwards, each vertex of the two

¹ ATLAS uses a right-handed coordinate system with its origin at the nominal interaction point (IP) and the z -axis along the beam pipe. The x -axis points from the IP to the center of the LHC ring, and the y -axis points upwards.

pairs is refit with a J/ψ or $\psi(2S)$ mass constraint [30]. The resolution of the TQ mass with these mass constraints ($m_{4\mu}$) is about 0.33% for $X(6900)$. Events are required to contain at least one reconstructed 4μ candidate.

The *loose* identification selection criteria [31] are required for all muon candidates. Depending on the muon trigger thresholds and muon identification requirements, different muon momenta on the four muons are required. Several requirements are imposed on the following variables to further suppress the background: the vertex fit quality based on χ^2 per degrees of freedom N , the signed distances between the primary² and reconstructed 4μ vertices ($L_{xy}^{4\mu}$), and between the former vertices and the di-muon mass-constrained sub-vertices ($L_{xy}^{\text{di-}\mu}$). Events with $\Delta R < 0.25$ ³ between the two reconstructed charmonia are used to study the signal, whereas events with $\Delta R \geq 0.25$ are used to validate the shape of the 4μ mass distribution for the SPS background and constrain its normalization. The shape of the signal 4μ mass distribution is not much affected by this requirement. A summary of the kinematic requirements for the analysis regions is listed in Table 1.

Table 1: Summary of event selection requirements for different regions.

Signal region	Control region	Non-prompt region
Di-muon or tri-muon triggers, oppositely charged muons from each charmonium, <i>loose</i> muons, $p_T^{1,2,3,4} > 4, 4, 3, 3$ GeV and $ \eta_{1,2,3,4} < 2.5$ for the four muons, $m_{J/\psi} \in [2.94, 3.25]$ GeV, or $m_{\psi(2S)} \in [3.56, 3.80]$ GeV, Loose vertex requirements $\chi^2_{4\mu}/N < 40$ ($N = 5$) and $\chi^2_{\text{di-}\mu}/N < 100$ ($N = 2$),		
Vertex $\chi^2_{4\mu}/N < 3$, $L_{xy}^{4\mu} < 0.2$ mm, $ L_{xy}^{\text{di-}\mu} < 0.3$ mm, $m_{4\mu} < 11$ GeV,	Vertex $\chi^2_{4\mu}/N > 6$,	
$\Delta R < 0.25$ between charmonia	$\Delta R \geq 0.25$ between charmonia	or $ L_{xy}^{\text{di-}\mu} > 0.4$ mm

The SPS and DPS backgrounds contain two prompt charmonia and are modeled by MC simulations. Because the event generator does not reproduce the data distributions well, kinematic corrections are derived from two dedicated control regions. Since SPS (DPS) events are characterized by two charmonia which are nearby (distant) in $\eta - \phi$ space, the control region is defined with a low (high) 4μ mass sideband not overlapping with the resonances. The corrections are implemented by assigning event weights to MC simulations such that distributions of kinematic variables such as di- J/ψ p_T , $\Delta\phi$ and $\Delta\eta$ between charmonia, and the lowest muon p_T match the data in the control regions. Agreement between the prediction and data in the SPS and DPS control regions is observed before and after the ΔR requirement. The non-prompt background also contains two charmonia, albeit originating from b -hadron decays. These typically contain a decay vertex that is displaced from the primary pp interaction. This background is also modeled using MC simulation, but normalized and validated by dedicated control regions obtained by reversing the vertex quality requirements as shown in Table 1. Events from prompt single charmonium production and non-resonant di-muon production are collectively called Others, and have at least one charmonium candidate containing random combinations of mostly fake muons. Fake muons are tracks,

² The primary interaction vertex is the collision vertex reconstructed excluding the 4μ candidate tracks and with the smallest distance of closest approach in z from the 4μ vertex.

³ The angular distance is defined as $\Delta R = \sqrt{\Delta\eta^2 + \Delta\phi^2}$, with η and ϕ being the pseudorapidity and azimuthal angle of a particle, respectively.

typically charged hadrons, that are misidentified as muons. A data-driven method is used because MC simulations do not accurately estimate this kind of background. A fake muon control region is defined by requiring that one charmonium candidate contains a track that is not reconstructed as a muon candidate, with all the other requirements kept unchanged. To model the Others background in the signal region using events from the fake region, events with di-muons in the charmonium mass sidebands are used for both the normalization factors and kinematic shape corrections for Others.

In the di- J/ψ channel, events from resonances in the $J/\psi + \psi(2S)$ channel via $\psi(2S) \rightarrow J/\psi + X$, $\psi(2S) \rightarrow \gamma\chi_{cJ}$, and $\chi_{cJ} \rightarrow \gamma J/\psi$, where particles other than di- J/ψ are ignored, are included as the feed-down background. Its yield in di- J/ψ and the signal in $J/\psi + \psi(2S)$ are related by

$$N_{\text{fd}} = \frac{\mathcal{B}'\epsilon'}{\mathcal{B}(\psi(2S) \rightarrow \mu\mu)\epsilon} N, \quad (1)$$

where ϵ and N (ϵ' and N_{fd}) are the signal (feed-down) efficiency and yield in $J/\psi + \psi(2S)$ (di- J/ψ), and branching fraction $\mathcal{B}' = [\mathcal{B}(\psi(2S) \rightarrow J/\psi + X) + \mathcal{B}(\psi(2S) \rightarrow \gamma\chi_{cJ}) \mathcal{B}(\chi_{cJ} \rightarrow \gamma J/\psi)] \mathcal{B}(J/\psi \rightarrow \mu\mu)$.

Unbinned maximum likelihood fits are performed to extract the signal information from data in the 4μ mass spectra. The likelihood used for the fit is

$$\mathcal{L} = \mathcal{L}_{SR}(\vec{\theta}, \vec{\lambda}) \cdot \mathcal{L}_{CR}(\vec{\theta}) \cdot \prod_{j=1}^K G(\theta'_j; \theta_j, \sigma_j), \quad (2)$$

where \mathcal{L}_{SR} (\mathcal{L}_{CR}) is the likelihood in the signal (control) region, $\vec{\lambda}$ are the parameters of interest, θ_j are nuisance parameters (NP) which account for systematic uncertainties shared between the two regions. Each NP has a Gaussian distribution constraint with a subsidiary measurement θ'_j , a mean θ_j and a width set to $\sigma_j = 1$ by construction. The background yields in the signal and control regions are related by a transfer factor which is obtained from the MC predictions or data-driven estimations.

In the di- J/ψ channel, the feed-down normalized by Eq. 1 is included as an additional background, and two fit models are considered. In model A, the signal probability density function in \mathcal{L}_{SR} consists of three interfering S-wave Breit–Wigner (BW) resonances multiplied with a phase space factor and convolved with a mass resolution function, which gives

$$f_s(x) = \left| \sum_{i=0}^2 \frac{z_i}{m_i^2 - x^2 - im_i\Gamma_i(x)} \right|^2 \sqrt{1 - \frac{4m_{J/\psi}^2}{x^2}} \otimes R(\theta), \quad (3)$$

where m_i ($\Gamma_i(x)$) are the masses (widths) of resonances, z_i are complex numbers representing the relative magnitudes and phases (z_1 is fixed to unity with zero phase for this purpose), $\Gamma_i(x) = \Gamma_i \frac{m_i}{x} \frac{q}{q_i}$, where q (q_i) is the momentum of one charmonium in the rest frame of the di-charmonium system at the invariant mass equal to x (m_i) [32], and R is the mass resolution function. The m_i terms are ordered by the subscripts. In model B, two resonances are considered. The first one interferes with the SPS background, while the second is standalone. The signal+SPS probability distribution function gives

$$f(x) = \left(\left| \frac{z_0}{m_0^2 - x^2 - im_0\Gamma_0(x)} + Ae^{i\phi} \right|^2 + \left| \frac{z_2}{m_2^2 - x^2 - im_2\Gamma_2(x)} \right|^2 \right) \sqrt{1 - \frac{4m_{J/\psi}^2}{x^2}} \otimes R(\theta), \quad (4)$$

where A and ϕ are the SPS background amplitude and phase relative to the resonance at m_0 . In this model, the control region becomes irrelevant and is excluded from the likelihood given in Eq. 2.

Models A and B are analogous to models I and II of the LHCb study [3], respectively. However, interferences between the signal resonances are introduced in model A, which is not done in the analysis by LHCb. For comparison, a two-resonance model with interference, and a three-resonance model without interferences, are also tried. It is found that when compared with model A, these models are excluded with a confidence level of more than 95% based on toy MC studies.

In the $J/\psi + \psi(2S)$ channel, two fit models are also considered. Model α assumes that the same interfering resonances observed in the di- J/ψ channel also decay into $J/\psi + \psi(2S)$, in addition to a standalone fourth resonance in this channel. The signal probability distribution function gives

$$f_s(x) = \left(\left| \sum_{i=0}^2 \frac{z_i}{m_i^2 - x^2 - im_i\Gamma_i(x)} \right|^2 + \left| \frac{z_3}{m_3^2 - x^2 - im_3\Gamma_3(x)} \right|^2 \right) \sqrt{1 - \left(\frac{m_{J/\psi} + m_{\psi(2S)}}{x} \right)^2} \otimes R(\theta), \quad (5)$$

where the parameters of the first three resonances, whose contribution appears as a structure just above the $m_{J/\psi} + m_{\psi(2S)}$ mass threshold, are fixed to the values from the fit to the di- J/ψ channel. In contrast, model β assumes a single resonance in this channel (i.e., without the $z_{0,1,2}$ terms in Eq. 5).

The systematic uncertainties are classified into those affecting exclusively normalizations, and those affecting the mass spectrum shape as well. Only the latter are relevant, since the signal and background normalizations are freely floating parameters. The systematic uncertainties in $m_{4\mu}$, with and without the muon momentum calibration corrections, are treated as resolution uncertainties. Because the resolution of the $m_{4\mu}$ is mass dependent and a constant mass is used in the nominal fit, resolutions in different mass ranges are treated as systematic uncertainties. A shape uncertainty is assigned to account for bin-to-bin fluctuations from the limited MC sample size for backgrounds. In the SPS background, a PYTHIA model parameter uncertainty from pT0timesMPI [18], which controls the suppression of the soft double charmonia production, is assigned, and its nominal value is tuned to data in the SPS control region. A shape uncertainty in the background due to residual di-charmonium p_T mismodeling is applied. Based on toy MC studies, biases from the fit in the resonance parameters are also considered as systematic uncertainties. The P and D-wave BW functions are substituted for the S-wave for resonances away from the threshold to estimate systematic uncertainties due to different orbital angular momentum assumptions⁴. Systematic shape variations in the $X(6900)$ in the di- J/ψ channel, and in the second resonance for the $J/\psi + \psi(2S)$ channel due to the ΔR and muon p_T requirements are considered as well. In the di- J/ψ channel, a 4th resonance around 7.2 GeV (hinted by the LHCb analysis) is added to the fit, and the feed-down background normalizations are varied according to the uncertainties in $J/\psi + \psi(2S)$. The transfer factor uncertainty is dominated by the SPS model parameter, so it is not treated as a separate NP. In the $J/\psi + \psi(2S)$ channel, the uncertainty in a transfer factor between the signal and control regions, and a shape uncertainty derived from the non-prompt region due to Others (shape inconsistency), are included. Interference between the 4th resonance and the other ones are included in systematic uncertainties.

The 4μ mass spectra fit to data in the two channels are shown in Figure 1. The fitted masses and widths of resonances are given in Table 2. Both the significance of all resonances, and the one for

⁴ The first resonance at the threshold is always assumed to be S-wave, as the data has no constraining power for its width when $L = 1, 2$.

$X(6900)$ alone, far exceed 5σ ⁵. The mass of the third resonance, m_2 , is consistent with the LHCb mass. Although both the models A and B describe the data well, the broad structure at the lower mass could result from other physical effects, such as the feed-down from higher di-charmonium resonances, e.g., $T_{cc\bar{c}\bar{c}} \rightarrow \chi_{cJ}\chi_{cJ'} \rightarrow J/\psi J/\psi\gamma\gamma$ where the soft photons are not reconstructed. In the $J/\psi + \psi(2S)$ channel, the signal significance with signal shape parameters of model α (β) fixed to their best-fit values is 4.7σ (4.3σ). In the fit with model α , the significance of the second resonance alone is found to be 3.0σ .

Table 2: The fitted masses and natural widths (in GeV), and relative uncertainties of signal yields ($\Delta s/s$) in the di- J/ψ and $J/\psi + \psi(2S)$ channels. The results of both the models are given in each channel. The first uncertainties are statistical while the second ones are systematic.

di- J/ψ	model A	model B
m_0	$6.41 \pm 0.08^{+0.08}_{-0.03}$	$6.65 \pm 0.02^{+0.03}_{-0.02}$
Γ_0	$0.59 \pm 0.35^{+0.12}_{-0.20}$	$0.44 \pm 0.05^{+0.06}_{-0.05}$
m_1	$6.63 \pm 0.05^{+0.08}_{-0.01}$	—
Γ_1	$0.35 \pm 0.11^{+0.11}_{-0.04}$	—
m_2	$6.86 \pm 0.03^{+0.01}_{-0.02}$	$6.91 \pm 0.01 \pm 0.01$
Γ_2	$0.11 \pm 0.05^{+0.02}_{-0.01}$	$0.15 \pm 0.03 \pm 0.01$
$\Delta s/s$	$\pm 5.1\%^{+8.1\%}_{-8.9\%}$	—
$J/\psi + \psi(2S)$	model α	model β
m_3 or m	$7.22 \pm 0.03^{+0.01}_{-0.03}$	$6.96 \pm 0.05 \pm 0.03$
Γ_3 or Γ	$0.09 \pm 0.06^{+0.06}_{-0.03}$	$0.51 \pm 0.17^{+0.11}_{-0.10}$
$\Delta s/s$	$\pm 21\% \pm 14\%$	$\pm 20\% \pm 12\%$

⁵ The asymptotic formula based on the profile likelihood ratio, $Z = \sqrt{2 \ln \frac{L(\hat{s}, \hat{\theta})}{L(0, \hat{\theta})}}$, is used to calculate the overall significance, where s is the signal yield and θ are NPs [33]. Similarly for $X(6900)$ alone, $Z = \sqrt{2 \ln \frac{L(\hat{z}_3, \hat{\theta})}{L(0, \hat{\theta})}}$ is used. In the calculations, the signal shape parameters are all fixed to their best-fit values.

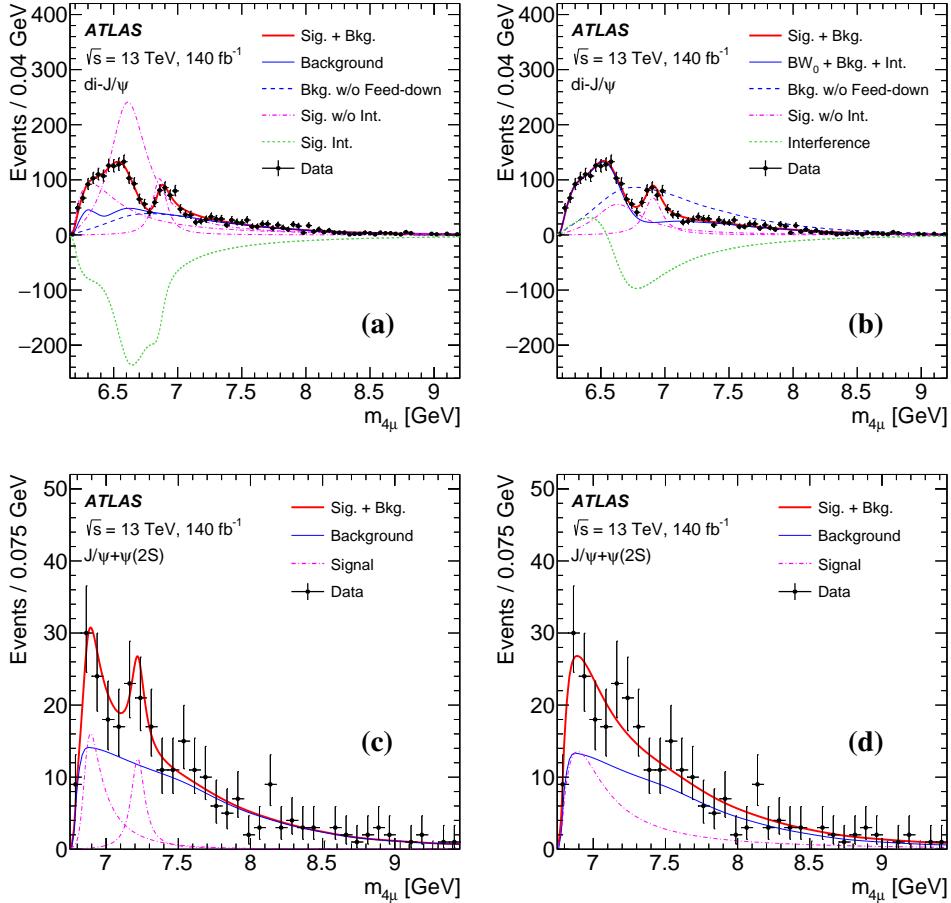

Figure 1: The fit to the mass spectra in the signal regions in the di- J/ψ (a,b) and $J/\psi+\psi(2S)$ (c,d) channels. Fit results for models A (a), B (b), α (c) and β (d) are shown. The purple dash-dotted lines represent the components of individual resonances, and the green short dashed ones represent the interferences among them.

In conclusion, the results of a search for potential $cc\bar{c}\bar{c}$ tetraquarks decaying into a pair of J/ψ charmonium states, or into a J/ψ and $\psi(2S)$, in the 4μ final state are presented based on $p p$ collisions data collected by the ATLAS experiment at $\sqrt{s} = 13$ TeV corresponding to an integrated luminosity of 140 fb^{-1} . A significant excess of events (far exceeding 5σ) in data above the expected background is observed in the di- J/ψ channel. Analogous to LHCb observations, a broad structure at lower mass and a resonance around 6.9 GeV are observed. A three-resonance model with interferences, or a model with the lower broad structure interfering with the SPS background, describes the excess better than models with fewer interfering resonances or with no interferences. In the $J/\psi+\psi(2S)$ channel, a 4.7σ excess of events is observed when considering a model involving two resonances, one of which is near the 6.9 GeV threshold. In both channels, details of the lower-mass structure cannot be discerned directly from the data, and other interpretations (e.g. multiple non-interfering resonances, reflection effects and threshold enhancements) cannot be excluded. More data are required to better characterize the excesses observed in both channels.

We thank CERN for the very successful operation of the LHC, as well as the support staff from our institutions without whom ATLAS could not be operated efficiently.

The crucial computing support from all WLCG partners is acknowledged gratefully, in particular from CERN, the ATLAS Tier-1 facilities at TRIUMF (Canada), NDGF (Denmark, Norway, Sweden), CC-IN2P3 (France), KIT/GridKA (Germany), INFN-CNAF (Italy), NL-T1 (Netherlands), PIC (Spain), ASGC (Taiwan), RAL (UK) and BNL (USA), the Tier-2 facilities worldwide and large non-WLCG resource providers. Major contributors of computing resources are listed in Ref. [34].

Appendix

The J/ψ and 4μ mass distributions of data and predictions in the signal regions of the two channels before the fits are shown in Figure 2(a,b,c). Similar 4μ mass distributions in the control regions are shown in Figure 3. The systematic uncertainties in the fitted masses and widths of the highest resonances in models A and α of the two channels are summarized in Table 3.

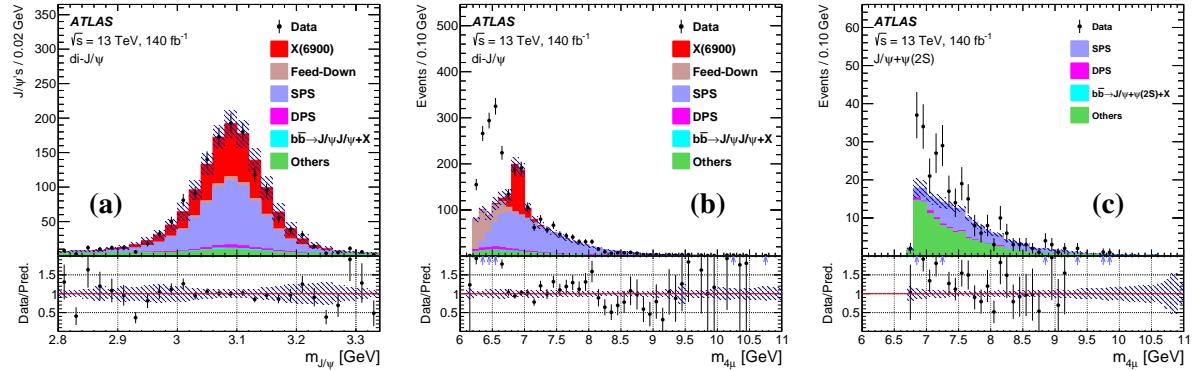

Figure 2: The J/ψ mass spectrum with $6.7 \text{ GeV} < m_{4\mu} < 7.1 \text{ GeV}$ (a) and the 4μ mass spectrum (b) in the signal region in the di- J/ψ channel, and the similar mass spectrum in the $J/\psi+\psi(2S)$ channel (c). The signal from the $X(6900)$ is scaled to match data around 6.9 GeV. The bars and shaded areas represent uncertainties of data and predictions in each bin, respectively. The arrows in the lower panel indicate that the ratio of data to prediction is out of range in that bin.

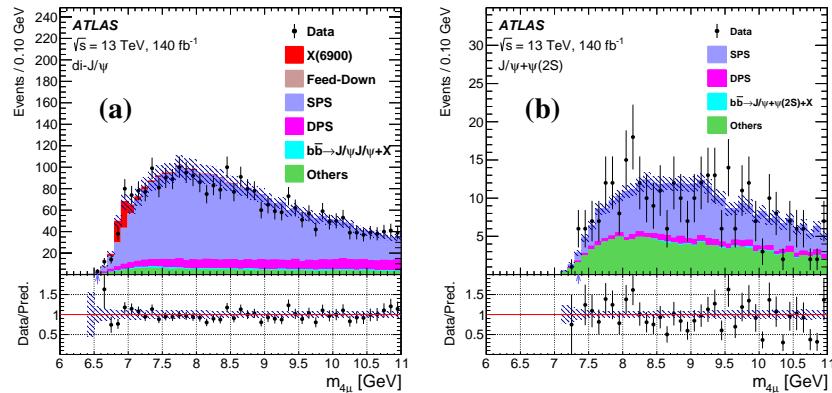

Figure 3: The 4μ mass spectra in the control regions in the di- J/ψ (a) and $J/\psi+\psi(2S)$ (b) channels. The bars and shaded areas represent uncertainties of data and predictions in each bin, respectively. The arrows in the lower panel indicate that the ratio of data to prediction is out of range in that bin.

Table 3: Different sources of systematic uncertainty in the mass and natural width (in MeV) of the third (second) resonance in model A (α) of the di- J/ψ ($J/\psi+\psi(2S)$) channel.

Systematic Uncertainties (MeV)	di- J/ψ		$J/\psi+\psi(2S)$

- ¹¹³Institute for Mathematics, Astrophysics and Particle Physics, Radboud University/Nikhef, Nijmegen;

Netherlands.

¹¹⁴Nikhef National Institute for Subatomic Physics and University of Amsterdam, Amsterdam; Netherlands.

¹¹⁵Department of Physics, Northern Illinois University, DeKalb IL; United States of America.

¹¹⁶(*a*) New York University Abu Dhabi, Abu Dhabi; (*b*) United Arab Emirates University, Al Ain; (*c*) University of Sharjah, Sharjah; United Arab Emirates.

¹¹⁷Department of Physics, New York University, New York NY; United States of America.

¹¹⁸Ochanomizu University, Otsuka, Bunkyo-ku, Tokyo; Japan.

¹¹⁹Ohio State University, Columbus OH; United States of America.

¹²⁰Homer L. Dodge Department of Physics and Astronomy, University of Oklahoma, Norman OK; United States of America.

¹²¹Department of Physics, Oklahoma State University, Stillwater OK; United States of America.

¹²²Palacký University, Joint Laboratory of Optics, Olomouc; Czech Republic.

¹²³Institute for Fundamental Science, University of Oregon, Eugene, OR; United States of America.

¹²⁴Graduate School of Science, Osaka University, Osaka; Japan.

¹²⁵Department of Physics, University of Oslo, Oslo; Norway.

¹²⁶Department of Physics, Oxford University, Oxford; United Kingdom.

¹²⁷LPNHE, Sorbonne Université, Université Paris Cité, CNRS/IN2P3, Paris; France.

¹²⁸Department of Physics, University of Pennsylvania, Philadelphia PA; United States of America.

¹²⁹Department of Physics and Astronomy, University of Pittsburgh, Pittsburgh PA; United States of America.

¹³⁰(*a*) Laboratório de Instrumentação e Física Experimental de Partículas - LIP, Lisboa; (*b*) Departamento de Física, Faculdade de Ciências, Universidade de Lisboa, Lisboa; (*c*) Departamento de Física, Universidade de Coimbra, Coimbra; (*d*) Centro de Física Nuclear da Universidade de Lisboa, Lisboa; (*e*) Departamento de Física, Universidade do Minho, Braga; (*f*) Departamento de Física Teórica y del Cosmos, Universidad de Granada, Granada (Spain); (*g*) Departamento de Física, Instituto Superior Técnico, Universidade de Lisboa, Lisboa; Portugal.

¹³¹Institute of Physics of the Czech Academy of Sciences, Prague; Czech Republic.

¹³²Czech Technical University in Prague, Prague; Czech Republic.

¹³³Charles University, Faculty of Mathematics and Physics, Prague; Czech Republic.

¹³⁴Particle Physics Department, Rutherford Appleton Laboratory, Didcot; United Kingdom.

¹³⁵IRFU, CEA, Université Paris-Saclay, Gif-sur-Yvette; France.

¹³⁶Santa Cruz Institute for Particle Physics, University of California Santa Cruz, Santa Cruz CA; United States of America.

¹³⁷(*a*) Departamento de Física, Pontificia Universidad Católica de Chile, Santiago; (*b*) Millennium Institute for Subatomic physics at high energy frontier (SAPHIR), Santiago; (*c*) Instituto de Investigación Multidisciplinario en Ciencia y Tecnología, y Departamento de Física, Universidad de La Serena; (*d*) Universidad Andres Bello, Department of Physics, Santiago; (*e*) Instituto de Alta Investigación, Universidad de Tarapacá, Arica; (*f*) Departamento de Física, Universidad Técnica Federico Santa María, Valparaíso; Chile.

¹³⁸Department of Physics, University of Washington, Seattle WA; United States of America.

¹³⁹Department of Physics and Astronomy, University of Sheffield, Sheffield; United Kingdom.

¹⁴⁰Department of Physics, Shinshu University, Nagano; Japan.

¹⁴¹Department Physik, Universität Siegen, Siegen; Germany.

¹⁴²Department of Physics, Simon Fraser University, Burnaby BC; Canada.

¹⁴³SLAC National Accelerator Laboratory, Stanford CA; United States of America.

¹⁴⁴Department of Physics, Royal Institute of Technology, Stockholm; Sweden.

- ¹⁴⁵Departments of Physics and Astronomy, Stony Brook University, Stony Brook NY; United States of America.
- ¹⁴⁶Department of Physics and Astronomy, University of Sussex, Brighton; United Kingdom.
- ¹⁴⁷School of Physics, University of Sydney, Sydney; Australia.
- ¹⁴⁸Institute of Physics, Academia Sinica, Taipei; Taiwan.
- ^{149(a)}E. Andronikashvili Institute of Physics, Iv. Javakhishvili Tbilisi State University, Tbilisi; ^(b)High Energy Physics Institute, Tbilisi State University, Tbilisi; ^(c)University of Georgia, Tbilisi; Georgia.
- ¹⁵⁰Department of Physics, Technion, Israel Institute of Technology, Haifa; Israel.
- ¹⁵¹Raymond and Beverly Sackler School of Physics and Astronomy, Tel Aviv University, Tel Aviv; Israel.
- ¹⁵²Department of Physics, Aristotle University of Thessaloniki, Thessaloniki; Greece.
- ¹⁵³International Center for Elementary Particle Physics and Department of Physics, University of Tokyo, Tokyo; Japan.
- ¹⁵⁴Department of Physics, Tokyo Institute of Technology, Tokyo; Japan.
- ¹⁵⁵Department of Physics, University of Toronto, Toronto ON; Canada.
- ^{156(a)}TRIUMF, Vancouver BC; ^(b)Department of Physics and Astronomy, York University, Toronto ON; Canada.
- ¹⁵⁷Division of Physics and Tomonaga Center for the History of the Universe, Faculty of Pure and Applied Sciences, University of Tsukuba, Tsukuba; Japan.
- ¹⁵⁸Department of Physics and Astronomy, Tufts University, Medford MA; United States of America.
- ¹⁵⁹Department of Physics and Astronomy, University of California Irvine, Irvine CA; United States of America.
- ¹⁶⁰Department of Physics and Astronomy, University of Uppsala, Uppsala; Sweden.
- ¹⁶¹Department of Physics, University of Illinois, Urbana IL; United States of America.
- ¹⁶²Instituto de Física Corpuscular (IFIC), Centro Mixto Universidad de Valencia - CSIC, Valencia; Spain.
- ¹⁶³Department of Physics, University of British Columbia, Vancouver BC; Canada.
- ¹⁶⁴Department of Physics and Astronomy, University of Victoria, Victoria BC; Canada.
- ¹⁶⁵Fakultät für Physik und Astronomie, Julius-Maximilians-Universität Würzburg, Würzburg; Germany.
- ¹⁶⁶Department of Physics, University of Warwick, Coventry; United Kingdom.
- ¹⁶⁷Waseda University, Tokyo; Japan.
- ¹⁶⁸Department of Particle Physics and Astrophysics, Weizmann Institute of Science, Rehovot; Israel.
- ¹⁶⁹Department of Physics, University of Wisconsin, Madison WI; United States of America.
- ¹⁷⁰Fakultät für Mathematik und Naturwissenschaften, Fachgruppe Physik, Bergische Universität Wuppertal, Wuppertal; Germany.
- ¹⁷¹Department of Physics, Yale University, New Haven CT; United States of America.
- ^a Also Affiliated with an institute covered by a cooperation agreement with CERN.
- ^b Also at APC, Université Paris Cité, CNRS/IN2P3, Paris; France.
- ^c Also at Borough of Manhattan Community College, City University of New York, New York NY; United States of America.
- ^d Also at Center for High Energy Physics, Peking University; China.
- ^e Also at Center for Interdisciplinary Research and Innovation (CIRI-AUTH), Thessaloniki ; Greece.
- ^f Also at Centro Studi e Ricerche Enrico Fermi; Italy.
- ^g Also at CERN, Geneva; Switzerland.
- ^h Also at Département de Physique Nucléaire et Corpusculaire, Université de Genève, Genève; Switzerland.
- ⁱ Also at Departament de Fisica de la Universitat Autonoma de Barcelona, Barcelona; Spain.
- ^j Also at Department of Financial and Management Engineering, University of the Aegean, Chios; Greece.
- ^k Also at Department of Physics and Astronomy, Michigan State University, East Lansing MI; United

States of America.

^l Also at Department of Physics and Astronomy, University of Victoria, Victoria BC; Canada.

^m Also at Department of Physics, California State University, Sacramento; United States of America.

ⁿ Also at Department of Physics, King's College London, London; United Kingdom.

^o Also at Department of Physics, Royal Holloway University of London, Egham; United Kingdom.

^p Also at Department of Physics, University of Fribourg, Fribourg; Switzerland.

^q Also at Department of Physics, University of Thessaly; Greece.

^r Also at Department of Physics, Westmont College, Santa Barbara; United States of America.

^s Also at Fakultät für Mathematik und Naturwissenschaften, Fachgruppe Physik, Bergische Universität Wuppertal, Wuppertal; Germany.

^t Also at Hellenic Open University, Patras; Greece.

^u Also at Institutio Catalana de Recerca i Estudis Avancats, ICREA, Barcelona; Spain.

^v Also at Institut für Experimentalphysik, Universität Hamburg, Hamburg; Germany.

^w Also at Institute of Applied Physics, Mohammed VI Polytechnic University, Ben Guerir; Morocco.

^x Also at Institute of Particle Physics (IPP); Canada.

^y Also at Institute of Physics and Technology, Ulaanbaatar; Mongolia.

^z Also at Institute of Physics, Azerbaijan Academy of Sciences, Baku; Azerbaijan.

^{aa} Also at Institute of Theoretical Physics, Ilia State University, Tbilisi; Georgia.

^{ab} Also at Lawrence Livermore National Laboratory, Livermore; United States of America.

^{ac} Also at The Collaborative Innovation Center of Quantum Matter (CICQM), Beijing; China.

^{ad} Also at TRIUMF, Vancouver BC; Canada.

^{ae} Also at Università di Napoli Parthenope, Napoli; Italy.

^{af} Also at University of Colorado Boulder, Department of Physics, Colorado; United States of America.

^{ag} Also at Washington College, Chestertown, MD; United States of America.
