ERRATUM TO: [2021 JINST 16 P03025](#)

The previously published figure 26 is replaced, which corrects a plotting mistake affecting only this figure. The underlying simulations of the RNO-G design specifications used for the article have not changed. Data corresponding to the new figure is available at [\[1\]](#).

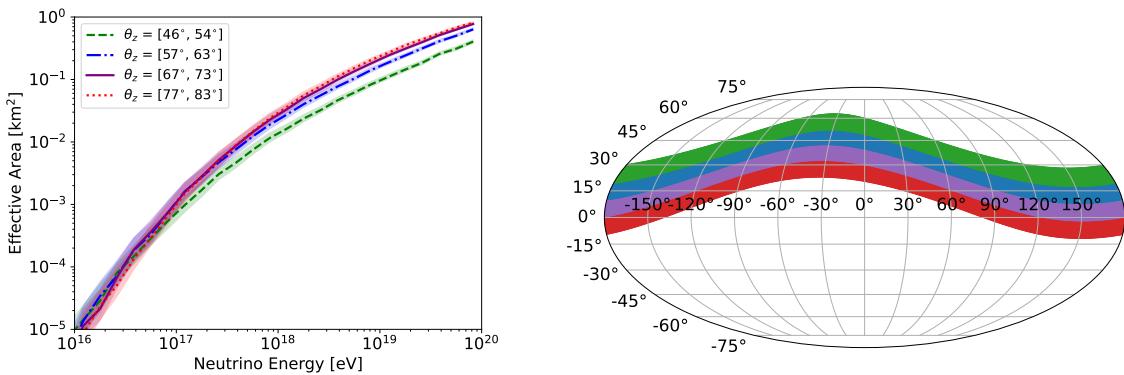

Figure 26. RNO-G instantaneous sky coverage. Left: simulated effective area as a function of neutrino energy is shown for four zenith bands, centered at 50° , 60° , 70° , and 80° . Shaded regions indicate the range given by different trigger of $1.5\sigma_{\text{noise}}$ and $2.5\sigma_{\text{noise}}$. Simulations were performed for the full RNO-G array of 35 stations with a distance of 1 km. Right: these bands are projected in Right Ascension (RA) and Declination (Dec) for one particular time of day to illustrate the instantaneous sky coverage. For zenith angles $< 45^\circ$ or $> 90^\circ$ RNO-G sensitivity is strongly reduced (< 0.1 fraction of maximum effective area).

Acknowledgments

The RNO-G collaboration would like to thank their members Steffen Hallmann and Felix Schlüter for identifying the issue with the figure and correcting it.
